

SPDX[®] Specification v3.0.1

1 Scope

The System Package Data Exchange (SPDX[®]) specification defines an open standard for communicating bill of materials (BOM) information for different topic areas.

SPDX defines an underlying data model as well as multiple serialization formats to encode that data model.

SPDX metadata includes details about creation and distribution, including the following:

- software composition, for collections of software (Packages), individual Files, and portions of files (Snippets)
- software build information
- artificial intelligence (AI) models
- datasets
- creator, supplier and distributor identity information
- provenance and integrity
- licenses and copyrights, including a curated list of licenses and exceptions
- security vulnerabilities, defects, and other quality data
- relationships between system elements
- software usage and lifecycle
- mechanisms to enable annotating SPDX elements and linking between multiple SPDX Documents

4 Conformance

4.1 Alternate notation for some conformance requirements

This standard contains more than a few cardinality assertions, each of which indicates the minimum and maximum number of times a property may appear. These are represented by using “minCount” and “maxCount” respectively. The absolute minimum number of occurrences is zero (0), while for an unbounded maximum number of occurrences a star (*) is being used.

Here are some examples:

- minCount: 1
- maxCount: *
- Cardinality: 0..1
- Cardinality: 0..*
- Cardinality: 1..1
- Cardinality: 1..*

Each of these assertions can easily be understood as to whether a feature is required, and if so, how many occurrences are required; also, whether a feature is permitted, and if so, in what number. As this is the format long familiar to the SPDX community, it has been preserved in this specification.

4.2 Introduction to Profiles

Profile is the term for a compliance point within the SPDX community across The Linux Foundation and OMG. The System Package Data Exchange (SPDX) specification defines the following nine compliance points, defined as “Profiles”:

- Core Profile
- Software Profile
- Security Profile
- Licensing Profile
- Dataset Profile
- AI Profile
- Build Profile
- Lite Profile
- Extension Profile

The Core Profile is mandatory. All others are optional.

4.3 Core Profile compliance point

The Core Profile includes the definitions of classes properties and vocabularies usable by all SPDX profiles when producing or consuming SPDX content. Although the classes, properties and vocabularies are somewhat extensive, the required fields are rather minimal to allow maximum flexibility while meeting minimum SBOM requirements. Software that conforms to the SPDX specification at the Core Profile compliance point shall be able to import and export serialized documents that conform with one of the defined SPDX serialization formats.

Conformance to the Core Profile compliance point is mandatory for all other SPDX profiles.

This compliance point, in combination with the Software Profile compliance point, provides a baseline of functionality that facilitates interchange of the bills of materials information produced by tools supporting SPDX.

4.4 Software Profile compliance point

The Software Profile includes the definitions of classes, properties and vocabularies for referring to and conveying information about software and is usable by all SPDX profiles when producing or consuming SPDX content.

Software that conforms to the SPDX specification at the Software Profile compliance point shall be able to import and export serialized documents that conform with one of the SPDX serialization formats defined SPDX serialization formats.

Conformance to the Software Profile compliance point does not entail support for the Licensing, Dataset, AI, Build, Lite, or Extension profiles of the SPDX.

This compliance point, in combination with the Core Profile compliance point, provides a baseline of functionality that facilitates interchange of the bills of materials information produced by tools supporting SPDX.

4.5 Security Profile compliance point

The Security Profile captures security-related information when producing or consuming SPDX content.

Software that conforms to the SPDX specification at the security profile compliance point shall be able to import and export serialized documents that conform with one of the SPDX serialization formats defined SPDX serialization formats, including the properties and relationships specified in the security profile, which are in support of exchanging information about software vulnerabilities that may exist, the severity of those vulnerabilities, and a mechanism to express how a vulnerability may affect a specific software element including if a fix is available.

Conformance to the Security Profile compliance point does not entail support for the Licensing, Dataset, AI, Build, Lite, or Extension profiles of the SPDX.

This compliance point facilitates interchange of the security information produced by tools supporting SPDX.

4.6 Licensing Profile compliance point

The Licensing Profile includes capturing details relevant to software licensing and intellectual property information when producing or consuming SPDX content. Specifically, software that conforms to the SPDX specification at the Licensing profile compliance point shall be able to import and export serialized documents that conform with one of the SPDX serialization formats defined SPDX serialization formats, including the classes and fields that comprise the SPDX License Expression syntax and that relate to the SPDX License List.

There are two associated profiles, the SimpleLicensing Profile and the ExpandedLicensing profiles. Both allow expression of the same information, albeit in different ways.

Conformance to the Licensing Profile compliance point does not entail support for the Software, Security, Dataset, AI, Build, Lite, or Extension profiles of the SPDX.

This compliance point facilitates interchange of the licensing documents expressing which licenses and copyright notices are determined by persons or automated tooling to apply to distributions of software that are produced by tools supporting SPDX.

4.7 Dataset Profile compliance point

The Dataset Profile captures the relevant information about the datasets used in an AI system or other applications when producing or consuming SPDX content.

Software that conforms to the SPDX specification at the Dataset Profile compliance point shall be able to import and export serialized documents that conform with one of the SPDX serialization formats defined SPDX serialization formats, including details such as dataset names, versions, sources, associated metadata, licensing information, and any other relevant attributes. The Dataset Profile can convey a description or summary of a dataset, including metadata, characteristics, and statistical information about the data. The Dataset Profile can convey insights into the structure, format, content, and properties of a dataset, helping users understand and analyze the data more effectively.

Conformance to the Dataset Profile compliance point does not entail support for the Software, Licensing, Security, AI, Build, Lite, or Extension profiles of the SPDX.

This compliance point facilitates interchange of the information about datasets produced by tools supporting SPDX.

4.8 AI Profile compliance point

The AI Profile captures an inventory list of software components and dependencies associated with an AI system when producing or consuming SPDX content.

Software that conforms to the SPDX specification at the AI Profile compliance point shall be able to import and export serialized documents that conform with one of the SPDX serialization formats defined SPDX serialization formats, including the information about software components and dependencies associated with artificial intelligence and machine learning (AI/ML) models and systems. This inventory includes the software frameworks, libraries, and other components used to build or deploy the AI system, along with relevant information about their versions, licenses, and useful security references including ethical and security information.

Conformance to the AI Profile compliance point does not entail support for the Software, Licensing, Security, Dataset, Build, Lite, or Extension profiles of the SPDX.

This compliance point facilitates interchange of the AI model related information produced by tools supporting SPDX.

4.9 Build Profile compliance point

The Build Profile captures build-related information when producing or consuming SPDX content.

Software that conforms to the SPDX specification at the Build Profile compliance point shall be able to import and export serialized documents that conform with one of the SPDX serialization formats defined SPDX serialization formats, including associated definitions to help express how software is generated and transformed. This includes encoding the inputs, outputs, procedures/instructions, environments and actors from the build process along with the associated evidence.

Conformance to the Build Profile compliance point does not entail support for the Software, Licensing, Security, Dataset, AI, Lite, or Extension profiles of the SPDX.

This compliance point facilitates interchange of the build information produced by tools supporting SPDX.

4.10 Lite Profile compliance point

The Lite Profile captures the minimum set of information required for license compliance in the software supply chain for producing or consuming SPDX content.

Software that conforms to the SPDX specification at the Lite Profile compliance point shall be able to import and export serialized documents that conform with one of the SPDX serialization formats defined SPDX serialization formats, including creation of the SBOM, package lists with licensing and other related items, and their relationships.

Conformance to the Lite Profile compliance point does not entail support for the Software, Licensing, Security, Dataset, AI, Build, or Extension profiles of the SPDX.

This compliance point facilitates interchange of minimal licensing information when produced by tools supporting SPDX.

4.11 Extension Profile compliance point

The Extension Profile captures extended tailored information when producing or consuming non-standard SPDX content in three ways:

- Support Profile-based extended characterization of Elements. Enables specification and expression of Element characterization extensions within any profile and namespace of SPDX without requiring changes to other profiles or namespaces and without requiring local subclassing of remote classes (which could inhibit ecosystem interoperability in some cases).
- Support extension of SPDX by adopting individuals or communities with Element characterization details uniquely specialized to their particular context. Enables adopting individuals or communities to utilize SPDX expressive capabilities along with expressing more arcane Element characterization details specific to them and not appropriate for standardization across SPDX.
- Support structured capture of expressive solutions for gaps in SPDX coverage from real-world use. Enables adopting individuals or communities to express Element characterization details they require that are not currently defined in SPDX but likely should be. Enables a practical pipeline that identifies gaps in SPDX that should be filled, expresses solutions to those gaps in a way that allows the identifying adopters to use the extended solutions with SPDX and does not conflict with current SPDX, can be clearly detected among the SPDX content exchange ecosystem, provides a clear and structured definition of gap solution that can be used as submission for revision to the SPDX standard.

Software that conforms to the SPDX specification at the Extension Profile compliance point shall be able to import and export serialized documents that conform with one of the SPDX serialization formats defined SPDX serialization formats, including the abstract Extension class serving as the base for all defined Extension subclasses.

Conformance to the Extension Profile compliance point does not entail support for the Licensing, Security, Dataset, AI, Build, or profiles of the SPDX but is expected to be used in combination with the other profiles to extend them.

This compliance point facilitates interchange of extended information that goes beyond the standard SPDX produced by tools supporting SPDX and is used between cooperating parties that understand the form of the extension and can produce and consume its non-standard content.

4.12 Trademark Compliance

To be designated an SPDX document, a file shall comply with the requirements of the SPDX Trademark License, as stated in the the SPDX Trademark Page.

The official copyright notice that shall be used with any verbatim reproduction and/or distribution of this SPDX Specification 3.0.1 is:

“Official SPDX® Specification 3.0.1 Copyright © 2010–2024 Linux Foundation and its Contributors. Licensed under the Community Specification License 1.0. All other rights are expressly reserved.”

The official copyright notice that shall be used with any non-verbatim reproduction and/or distribution of this SPDX Specification 3.0.1, including without limitation any partial use or combining this SPDX Specification with another work, is:

“This is not an official SPDX Specification. Portions herein have been reproduced from SPDX® Specification 3.0.1 found at spdx.dev. These portions are Copyright © 2010–2024 Linux Foundation and its Contributors, and are licensed under the Community Specification License 1.0 by the Linux Foundation and its Contributors. All other rights are expressly reserved by Linux Foundation and its Contributors.”

5 Model and serializations

5.1 Overview

This specification defines the data model of the SPDX standard, describing every piece of information about systems with software components. The data model is based on the Resource Description Framework (RDF) extensible knowledge representation data model, which provides a flexible and extensible way to represent and exchange information.

The data may be serialized in a variety of formats for storage and transmission.

5.2 RDF serialization

Since the data model is based on RDF, any SPDX data can be serialized in any of the multiple RDF serialization formats, including but not limited to:

- JSON-LD format as defined in JSON-LD 1.1;
- Turtle (Terse RDF Triple Language) format as defined in RDF 1.1 Turtle;
- N-Triples format as defined in RDF 1.1 N-Triples; and
- RDF/XML format as defined in RDF 1.1 XML Syntax.

The SPDX specification is accompanied by a JSON-LD context definition file that can be used to serialize SPDX in a much simpler and more human-readable JSON-LD format.

5.3 Canonical serialization

Canonical serialization is a single, consistent, normalized, deterministic, and reproducible form.

Such a canonical form normalizes things like ordering and formatting.

The content of the canonical serialization is exactly the same as the JSON-LD serialization of RDF data (see 4.2), just represented in a consistent way.

Canonical serialization is in JSON format, as defined in RFC 8259 (IETF STD 90), with the following additional characteristics:

- No line breaks
- Key names **MUST** be wrapped in double quotes
- No whitespace outside of strings

- `true`, `false` and `null`: the literal names must be lowercase; no other literal names are allowed
- Integers: represented in base 10 using decimal digits. This designates an integer component that may be prefixed with an optional minus sign. Leading zeros are not allowed.
- Strings: UTF-8 representation without specific canonicalisation. A string begins and ends with quotation marks (%x22). Any Unicode characters may be placed within the quotation marks, except for the two characters that MUST be escaped by a reverse solidus: quotation mark, reverse solidus, and the control characters (U+0000 through U+001F).
- Arrays: An array structure is represented as square brackets surrounding zero or more items. Items are separated by commas.
- Objects: An object structure is represented as a pair of curly brackets surrounding zero or more name/value pairs (or members). A name is a string containing only ASCII characters (0x21-0x7F). The names within an object must be unique. A single colon comes after each name, separating the name from the value. A single comma separates a value from a following name. The name/value pairs are ordered by name.

5.4 Serialization information

A collection of elements may be serialized in multiple formats.

An `SpdxDocument` element represents a collection of elements across all serialization data formats within the model.

The actual serialized bytes is represented by an `Artifact` element within the model.

A `Relationship` of type `serializedInArtifact` links an `SpdxDocument` to one or more serialized forms of itself.

When serializing a physical `SpdxDocument`, any property of the logical element that can be natively represented within the chosen serialization format (e.g., `@context` prefixes in JSON-LD instead of the `namespaceMap`) may utilize these native mechanisms. All remaining properties shall be serialized within the `SpdxDocument` element itself.

A serialization must not contain more than one `SpdxDocument`.

A given instance of serialization must not define more than one `SpdxDocument` element.

5.5 Serialization in JSON-LD

5.5.1 JSON-LD context file

JSON-LD contexts allow JSON documents to use simple, human-readable, locally defined terms while ensuring data interoperability across different systems.

The SPDX global JSON-LD context file must be used universally for all SPDX documents in JSON-LD format that adhere to a specific SPDX version.

SPDX global JSON-LD context file is available at: <https://spdx.org/rdf/3.0.1/spdx-context.jsonld>

All SPDX documents in JSON-LD format must include a reference to the SPDX global context file at the top level. This reference is achieved using the following JSON construct:

```
"@context": "https://spdx.org/rdf/3.0.1/spdx-context.jsonld"
```

The SPDX context file defines aliases for specific JSON-LD properties to improve compatibility with the SPDX model. These aliases are:

- `spdxId`: An alias for the `@id` property.
- `type`: An alias for the `@type` property.

Additional namespace mappings may be defined within a separate object within the context.

5.5.2 JSON-LD validation

An SPDX serialization in JSON-LD format is considered conformant to the SPDX specification if it adheres to the following two validation criteria:

- Structural validation: The JSON-LD document must structurally validate against the SPDX JSON Schema. This schema defines the expected structure of the JSON-LD document, including the required elements, data types, and permissible values.
- Semantic validation: The JSON-LD document must successfully validate against the SPDX OWL ontology. This ontology defines the expected relationships and constraints between SPDX elements. The SPDX OWL ontology also incorporates SHACL shape restrictions to further specify these constraints.

The SPDX JSON Schema is available at: <https://spdx.org/schema/3.0.1/spdx-json-schema.json>

The SPDX OWL ontology is available at: <https://spdx.org/rdf/3.0.1/spdx-model.ttl>

6 Core

Summary

The basis for all SPDX profiles.

Description

The Core namespace defines foundational concepts serving as the basis for all SPDX-3.0 profiles.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core>

<i>Name:</i>	Core
--------------	------

6.1 Classes

6.1.1 Agent

Summary

Agent represents anything with the potential to act on a system.

Description

The Agent class represents anything that has the potential to act on a system.

This could be a person, organization, software agent, etc.

This is not to be confused with tools that are used to perform tasks.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/Agent>

6.1.2 Annotation

Summary

An assertion made in relation to one or more elements.

Description

An Annotation is an assertion made in relation to one or more elements.

The `contentType` property describes the format of the `statement` property.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/Annotation>

6.1.3 Artifact**Summary**

A distinct article or unit within the digital domain.

Description

An artifact is a distinct article or unit within the digital domain, such as an electronic file, a software package, a device or an element of data.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/Artifact>

<i>Name:</i>	Artifact

6.1.4 Bom

Summary

A container for a grouping of SPDX-3.0 content characterizing details (provenence, composition, licensing, etc.) about a product.

Description

A Bill of Materials (BOM) is a container for a grouping of SPDX-3.0 content characterizing details about a product.

This could include details of the content and composition of the product, provenence details of the product and/or its composition, licensing information, known quality or security issues, etc.

6.1.5 Bundle

Summary

A collection of Elements that have a shared context.

Description

A bundle is a collection of Elements that have a shared context.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/Bundle>

<i>Name:</i>	Bundle
<i>Instantiability:</i>	Concrete
<i>SubclassOf:</i>	ElementCollection

Superclasses

- /Core/ElementCollection
- /Core/Element

Properties

Property	Type	minCount	maxCount
context	xsd:string	0	1

All properties (informative)

summary	xsd:string	0	1
verifiedUsing	IntegrityMethod	0	*

6.1.6 CreationInfo

Summary

Provides information about the creation of the Element.

Description

The CreationInfo provides information about who created the Element, and when and how it was created.

The dateTime created is often the date of last change (e.g., a git commit date), not the date when the SPDX data was created, as doing so supports reproducible builds.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/CreationInfo>

<i>Name:</i>	CreationInfo

6.1.7 DictionaryEntry

Summary

A key with an associated value.

Description

The class used for implementing a generic string mapping (also known as associative array, dictionary, or hash map) in SPDX.

Each DictionaryEntry contains a key-value pair which maps the key to its associated value.

To implement a dictionary, this class is to be used in a collection with unique keys.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/DictionaryEntry>

<i>Name:</i>	DictionaryEntry
<i>Instantiability:</i>	Concrete

Properties

Property	Type	minCount	maxCount

value	xsd:string	0	1

6.1.8 Element

Summary

Base domain class from which all other SPDX-3.0 domain classes derive.

Description

An Element is a representation of a fundamental concept either directly inherent to the Bill of Materials (BOM) domain or indirectly related to the BOM domain and necessary for contextually characterizing BOM concepts and relationships. Within SPDX-3.0 structure this is the base class acting as a consistent, unifying, and interoperable foundation for all explicit and inter-relatable content objects.

6.1.9 ElementCollection

Summary

A collection of Elements, not necessarily with unifying context.

Description

An ElementCollection is a collection of Elements, not necessarily with unifying context.

Note that all ElementCollections must conform to the Core profile even if the Core profile is not specified in the profileConformance property.

If the profileConformance property is not provided, “core” is to be assumed as the default.

Constraints

- If the ElementCollection has at least 1 element, it must also have at least 1 rootElement.
- The element must not be of type SpdxDocument.
- The rootElement must not be of type SpdxDocument.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/ElementCollection>

6.1.10 ExternalIdentifier**Summary**

A reference to a resource identifier defined outside the scope of SPDX-3.0 content that uniquely identifies an Element.

Description

An ExternalIdentifier is a reference to a resource outside the scope of SPDX-3.0 content that provides a unique key within an established domain that can uniquely identify an Element.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/ExternalIdentifier>

<i>Name:</i>	ExternalIdentifier
<i>Instantiability:</i>	Concrete

Properties

Property	Type	minCount	maxCount

6.1.11 ExternalMap

Summary

A map of Element identifiers that are used within an SpdxDocument but defined external to that SpdxDocument.

Description

An external map is a map of Element identifiers that are used within an SpdxDocument but defined external to that SpdxDocument. The external map provides details about the externally-defined Element such as its provenance, where to retrieve it, and how to verify its integrity.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/ExternalMap>

<i>Name:</i>	ExternalMap
<i>Instantiability:</i>	Concrete

6.1.13 Hash**Summary**

A mathematically calculated representation of a grouping of data.

Description

A hash is a grouping of characteristics unique to the result of applying a mathematical algorithm that maps data of arbitrary size to a bit string (the hash) and is a one-way function, that is, a function which is practically infeasible to invert.

This is commonly used for integrity checking of data.

Please note that different profiles may also provide additional methods for verifying the integrity of specific subclasses of Elements.

Metadata

6.1.15 IntegrityMethod

Summary

Provides an independently reproducible mechanism that permits verification of a specific Element.

Description

An IntegrityMethod provides an independently reproducible mechanism that permits verification of a specific Element that correlates to the data in this SPDX document. This identifier enables a recipient to determine if anything in the original Element has been changed and eliminates confusion over which version or modification of a specific Element is referenced.

Please note that different profiles may also provide additional methods for verifying the integrity of specific subclasses of Elements.

6.1.17 NamespaceMap

Summary

A mapping between prefixes and namespace partial URIs.

Description

A namespace map allows the creator of a collection of serializable Elements to suggest shorter identifiers (“prefixes”) for specific namespace portions of Element IDs. This map is used in SPDX content serialization to provide a more human-readable and smaller serialized representation of the Elements.

For details of how NamespaceMap content is to be serialized please refer to the Model and serializations¹ clause and the various serialization format-specific files within the spdx-3-model repository².

Namespace maps support a variety of relevant use cases such as:

1. An SPDX content producer wishing to provide clarity of their serialization of an SPDX 2.X simple style collection where all content is newly minted and a single prefix-namespace is used. The consumer of SPDX content wishes to preserve the name space mapping provided by such a producer.

In this case, the consumer would record the namespace map prefixes in the NamespaceMap such that subsequent serializations could reproduce the prefixes / namespaces in the native serialization format.

2. An SPDX content producer wishing to maintain consistent prefix use and understanding across multiple different serialization formats of the produced content.

For example, an SBOM producer wishes to share/publish the SBOM as JSON-LD and XML. The producer can specify the preferred prefix mappings in the native serialization format using information from a single NamespaceMap accessible local to the producer.

3. An SPDX content consumer/producer wishing to maintain consistent prefix use while round tripping from SPDX content received, deserialized, modified/extended in some way, and then reserialized in the same serialization form.

In this case the prefix-namespace mappings utilized in the content are transformed from the original native namespace/prefix into the in memory NamespaceMap then transformed from the NamespaceMap back into the resultant serialization native namespace / prefix format.

6.1.19 PackageVerificationCode

Summary

An SPDX version 2.X compatible verification method for software packages.

Description

This verification method is provided for compatibility with SPDX 2.X.

Use of this verification code method is discouraged except for scenarios where the `contentIdentifier` property on `Artifact` can not be used.

This verification method provides an independently reproducible mechanism identifying specific contents of a package based on the actual files (except the SPDX document itself, if it is included in the package) that make up each package and that correlates to the data in this SPDX document.

This identifier enables a recipient to determine if any file in the original package (that the analysis was done on) has been changed and permits inclusion of an SPDX document as part of a package.

Algorithm:

```
templist = ""

for all files in the package {
  if file is a packageVerificationCodeExcludedFile
    skip it /* exclude SPDX analysis file */
  else
```

```

        append "algorithm(file)/n" to templist
    }

```

```

sort templist in ascending order by value

```

```

/* remove separators from ordered sequence */
valueslist = remove "/n"s from templist

```

```

if valueslist is empty
    hashValue = 0
else
    hashValue = algorithm(valueslist)

```

where `algorithm(string)` applies a hash algorithm on a string and returns the result in lowercase hexadecimal digits.

Required sort order: '0', '1', '2', '3', '4', '5', '6', '7', '8', '9', 'a', 'b', 'c', 'd', 'e', 'f' (ASCII order)

6.1.22 Relationship

Summary

Describes a relationship between one or more elements.

Description

A Relationship is a grouping of characteristics unique to an assertion that one Element is related to one or more other Elements in some way.

To explicitly assert that no such relationships exist, the `to` property should contain the `NoneElement` individual and no other elements.

A relationship that contains `NoneElement` and additional elements in the `to` property is not valid.

To explicitly assert that no assertions are being made regarding the existence of such relationships, the `to` property should contain the `NoAssertionElement` individual.

6.1.24 SpdxDocument

Summary

A collection of SPDX Elements that could potentially be serialized.

Description

The SpdxDocument provides a convenient way to express information about collections of SPDX Elements that could potentially be serialized as complete units (e.g., all in-scope SPDX data within a single JSON-LD file).

SpdxDocument is independent of any particular serialization format or instance.

Information we wish to preserve about a specific instance of serialization of this SPDX content is NOT expressed using the SpdxDocument but rather using an associated Artifact representing a particular instance of SPDX data physical serialization.

Any instance of serialization of SPDX data MUST NOT contain more than one SpdxDocument element definition.

Metadata

6.2.4 builtTime

Summary

Specifies the time an artifact was built.

Description

A builtTime specifies the time an artifact was built.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/builtTime>

<i>Name:</i>	builtTime
<i>Nature:</i>	DataProperty
<i>Range:</i>	DateTime

Referenced

- /Core/Artifact

6.2.5 comment

Summary

Provide consumers with comments by the creator of the Element about the Element.

Description

A comment is an optional field for creators of the Element to provide comments to the readers/reviewers of the document.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/comment>

<i>Name:</i>	comment
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Core/CreationInfo
- /Core/Element
- /Core/ExternalIdentifier
- /Core/ExternalRef
- /Core/IntegrityMethod

6.2.6 completeness

Summary

Provides information about the completeness of relationships.

Description

Completeness gives information about whether the provided relationships are complete, known to be incomplete or if no assertion is made either way.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/completeness>

<i>Name:</i>	completeness
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	RelationshipCompleteness

Referenced

- /Core/Relationship

6.2.7 contentType

Summary

Provides information about the content type of an Element or a Property.

Description

This field is a reasonable estimation of the content type of the Element or the Property, from a creator perspective. Content type is intrinsic to the Element or the Property, independent of how it is being used.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/contentType>

<i>Name:</i>	contentType
<i>Nature:</i>	DataProperty
<i>Range:</i>	MediaType

6.2.8 context

Summary

Gives information about the circumstances or unifying properties that Elements of the bundle have been assembled under.

Description

A context gives information about the circumstances or unifying properties that Elements of the bundle have been assembled under.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/context>

<i>Name:</i>	context
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Core/Bundle

6.2.9 created

Summary

Identifies when the Element was originally created.

Description

Created is a date that identifies when the Element was originally created.

The time stamp can serve as an indication as to whether the analysis needs to be updated.

This is often the date of last change (e.g., a git commit date), not the date when the SPDX data was created, as doing so supports reproducible builds.

6.2.13 dataLicense

Summary

Provides the license under which the SPDX documentation of the Element can be used.

Description

The data license provides the license under which the SPDX documentation of the Element can be used.

This is to alleviate any concern that content (the data or database) in an SPDX file is subject to any form of intellectual property right that could restrict the re-use of the information or the creation of another SPDX file for the same project(s).

This approach avoids intellectual property and related restrictions over the SPDX file, however individuals can still contract with each other to restrict release of specific collections of SPDX files (which map to software bill of materials) and the identification of the supplier of SPDX files.

Compliance with this document includes populating the SPDX fields therein with data related to such fields (“SPDX-Metadata”).

This document contains numerous fields where an SPDX file creator may provide relevant explanatory text in SPDX-Metadata. Without opining on the lawfulness of “database rights” (in jurisdictions where applicable), such explanatory text is copyrightable subject matter in most Berne Convention countries.

By using the SPDX specification, or any portion hereof, you hereby agree that any copyright rights (as determined by your jurisdiction) in any SPDX-Metadata, including without limitation explanatory text, shall be subject to the terms of the Creative Commons CC0 1.0 Universal license.

For SPDX-Metadata not containing any copyright rights, you hereby agree and acknowledge that the SPDX-Metadata is provided to you “as-is” and without any representations or warranties of any kind concerning the SPDX-Metadata, express, implied, statutory or otherwise, including without limitation warranties of title, merchantability, fitness for a particular purpose, non-infringement, or the absence of latent or other defects, accuracy, or the presence or absence of errors, whether or not discoverable, all to the greatest extent permissible under applicable law.

6.2.15 description**Summary**

Provides a detailed description of the Element.

Description

This field is a detailed description of the Element. It may also be extracted from the Element itself.

The intent is to provide recipients of the SPDX file with a detailed technical explanation of the functionality, anticipated use, and anticipated implementation of the Element.

This field may also include a description of improvements over prior versions of the Element.

6.2.33 locator

Summary

Provides the location of an external reference.

Description

A locator provides the location of an external reference.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/locator>

<i>Name:</i>	locator
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Core/ExternalRef

6.2.34 name

Summary

Identifies the name of an Element as designated by the creator.

Description

This field identifies the name of an Element as designated by the creator.

The name of an Element is an important convention and easier to refer to than the URI.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/name>

<i>Name:</i>	name
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Core/Element

6.2.35 namespace

Summary

Provides an unambiguous mechanism for conveying a URI fragment portion of an Element ID.

Description

A namespace provides an unambiguous mechanism for conveying a URI fragment portion of an Element ID.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/namespace>

<i>Name:</i>	namespace
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:anyURI

Referenced

- /Core/NamespaceMap

6.2.36 namespaceMap**Summary**

Provides a NamespaceMap of prefixes and associated namespace partial URIs applicable to an SpdxDocument and independent of any specific serialization format or instance.

Description

This field provides a NamespaceMap of prefixes and associated namespace partial URIs applicable to an SpdxDocument and independent of any specific serialization format or instance.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/namespaceMap>

<i>Name:</i>	namespaceMap
<i>Nature:</i>	ObjectProperty

6.2.40 profileConformance**Summary**

Describes one a profile which the creator of this ElementCollection intends to conform to.

Description

Describes a profile to which the creator of this ElementCollection intends to conform.

The profileConformance will apply to all Elements contained within the collection as well as the collection itself.

Conformance to a profile is defined by the additional restrictions documented in the profile specific documentation and schema files.

Use of this property allows the creator of an ElementCollection to communicate to consumers their intent to adhere to the profile additional restrictions.

The profileConformance has a default value of “core” if no other profileConformance is specified since all ElementCollections and Element must adhere to the Core profile.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/profileConformance>

<i>Name:</i>	profileConformance
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	ProfileIdentifierType

Referenced

- /Core/ElementCollection

6.2.41 relationshipType**Summary**

Information about the relationship between two Elements.

Description

This field provides information about the relationship between two Elements.

For example, you can represent a relationship between two different Files, between a Package and a File, between two Packages, or between one SpdxDocument and another SpdxDocument.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/relationshipType>

<i>Name:</i>	relationshipType
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	RelationshipType

Referenced

- /Core/Relationship

6.2.42 releaseTime**Summary**

Specifies the time an artifact was released.

Description

A releaseTime specifies the time an artifact was released.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/releaseTime>

<i>Name:</i>	releaseTime
<i>Nature:</i>	DataProperty
<i>Range:</i>	DateTime

- /Core/Artifact

6.2.43 rootElement**Summary**

This property is used to denote the root Element(s) of a tree of elements contained in a BOM.

Description

This property is used to denote the root Element(s) of a tree of elements contained in a BOM. The tree consists of other elements directly and indirectly related through properties or Relationships from the root.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/rootElement>

<i>Name:</i>	rootElement
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	Element

Referenced

- /Core/ElementCollection

6.2.44 scope**Summary**

Capture the scope of information about a specific relationship between elements.

Description

A scope is additional context about a relationship, that clarifies the relationship between elements.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/scope>

<i>Name:</i>	scope
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	LifecycleScopeType

Referenced

- /Core/LifecycleScopedRelationship

6.2.45 spdxId**Summary**

Identifies an Element to be referenced by other Elements.

Description

An spdxId uniquely identifies an Element which may thereby be referenced by other Elements. These references may be internal or external. While there may be several versions of the same Element, each one needs to be able to be referred to uniquely so that relationships between Elements can be clearly articulated.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/spdxId>

<i>Name:</i>	spdxId
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:anyURI

Referenced

- /Core/Element

6.2.46 specVersion

Summary

Provides a reference number that can be used to understand how to parse and interpret an Element.

Description

The specVersion provides a reference number that can be used to understand how to parse and interpret an Element. It will enable both future changes to the specification and to support backward compatibility.

The major version number shall be incremented when incompatible changes between versions are made (one or more sections are created, modified or deleted). The minor version number shall be incremented when backwards compatible changes are made. The patch version number shall be incremented when backward compatible bug fixes are made.

Here, parties exchanging information in accordance with the SPDX specification need to provide 100% transparency as to which SPDX specification version such information is conforming to.

Metadata

6.3 Vocabularies**6.3.1 AnnotationType****Summary**

Specifies the type of an annotation.

Description

AnnotationType specifies the type of an annotation.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/AnnotationType>

<i>Name:</i>	AnnotationType
--------------	----------------

Entries

other Used to store extra information about an Element which is not part of a review (e.g. extra information provided during the creation of the Element).

review Used when someone reviews the Element.

6.3.2 ExternalIdentifierType

Summary

Specifies the type of an external identifier.

Description

ExternalIdentifierType specifies the type of an external identifier.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/ExternalIdentifierType>

Name: ExternalIdentifierType

Entries

cpe22 Common Platform Enumeration Specification 2.2³

cpe23 Common Platform Enumeration: Naming Specification Version 2.3⁴

cve Common Vulnerabilities and Exposures identifiers, an identifier for a specific software flaw defined within the official CVE Dictionary and that conforms to the CVE specification⁵.

email Email address, as defined in RFC 3696 Section 3.

gitoid Gitoid⁷, stands for Git Object ID⁸. A gitoid of type blob is a unique hash of a binary artifact. A gitoid may represent either an Artifact Identifier⁹ for the software artifact or an Input Manifest Identifier¹⁰ for the software artifact's associated Artifact Input Manifest¹¹; this ambiguity exists because the Artifact Input Manifest is itself an artifact, and the gitoid of that artifact is its valid identifier. Gitoids calculated on software artifacts (Snippet, File, or Package Elements) should be recorded in the SPDX 3.0 SoftwareArtifact's contentIdentifier property. Gitoids calculated on the Artifact Input Manifest (Input Manifest Identifier) should be recorded in the SPDX 3.0 Element's externalIdentifier property. See OmniBOR Specification¹², a minimalistic specification for describing software Artifact Dependency Graphs¹³.

other Used when the type does not match any of the other options.

packageUrl Package URL, as defined in the corresponding Annex¹⁴ of this specification.

securityOther Used when there is a security related identifier of unspecified type.

swhid SoftWare Hash Identifier, a persistent intrinsic identifier for digital artifacts, such as files, trees (also known as directories or folders), commits, and other objects typically found in version control systems. The format of the identifiers is defined in the SWHID specification¹⁵ (ISO/IEC DIS 18670). They typically look like
swh : 1 : cnt : 94a9ed024d3859793618152ea559a168bbcbb5e2.

6.3.3 ExternalRefType

Summary

Specifies the type of an external reference.

Description

ExternalRefType specifies the type of an external reference.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/ExternalRefType>

<i>Name:</i> ExternalRefType

Entries

altDownloadLocation A reference to an alternative download location.

altWebPage A reference to an alternative web page.

binaryArtifact A reference to binary artifacts related to a package.

bower A reference to a Bower package. The package locator format, looks like `package#version`, is defined in the “install” section of Bower API documentation¹⁸.

buildMeta A reference build metadata related to a published package.

buildSystem A reference build system used to create or publish the package.

certificationReport A reference to a certification report for a package from an accredited/independent body.

chat A reference to the instant messaging system used by the maintainer for a package.

componentAnalysisReport A reference to a Software Composition Analysis (SCA) report.

cwe Common Weakness Enumeration¹⁹. A reference to a source of software flaw defined within the official CWE List²⁰ that conforms to the CWE specification²¹.

documentation A reference to the documentation for a package.

dynamicAnalysisReport A reference to a dynamic analysis report for a package.

eolNotice A reference to the End Of Sale (EOS) and/or End Of Life (EOL) information related to a package.

exportControlAssessment A reference to a export control assessment for a package.

funding A reference to funding information related to a package.

issueTracker A reference to the issue tracker for a package.

- license** A reference to additional license information related to an artifact.
- mailingList** A reference to the mailing list used by the maintainer for a package.
- mavenCentral** A reference to a Maven repository artifact. The artifact locator format is defined in the Maven documentation²² and looks like `groupId:artifactId[:version]`.
- metrics** A reference to metrics related to package such as OpenSSF scorecards.
- npm** A reference to an npm package. The package locator format is defined in the npm documentation²³ and looks like `package@version`.
- nuget** A reference to a NuGet package. The package locator format is defined in the NuGet documentation²⁴ and looks like `package/version`.
- other** Used when the type does not match any of the other options.
- privacyAssessment** A reference to a privacy assessment for a package.
- productMetadata** A reference to additional product metadata such as reference within organization's product catalog.
- purchaseOrder** A reference to a purchase order for a package.
- qualityAssessmentReport** A reference to a quality assessment for a package.
- releaseHistory** A reference to a published list of releases for a package.
- releaseNotes** A reference to the release notes for a package.
- riskAssessment** A reference to a risk assessment for a package.
- runtimeAnalysisReport** A reference to a runtime analysis report for a package.
- secureSoftwareAttestation** A reference to information assuring that the software is developed using security practices as defined by NIST SP 800-218 Secure Software Development Framework (SSDF) Version 1.1²⁵ or CISA Secure Software Development Attestation Form²⁶.
- securityAdversaryModel** A reference to the security adversary model for a package.
- securityAdvisory** A reference to a published security advisory (where advisory as defined per ISO 29147:2018²⁷) that may affect one or more elements, e.g., vendor advisories or specific NVD entries.
- securityFix** A reference to the patch or source code that fixes a vulnerability.
- securityOther** A reference to related security information of unspecified type.
- securityPenTestReport** A reference to a penetration test²⁸ report for a package.
- securityPolicy** A reference to instructions for reporting newly discovered security vulnerabilities for a package.
- securityThreatModel** A reference the security threat model²⁹ for a package.
- socialMedia** A reference to a social media channel for a package.

²⁹https://en.wikipedia.org/wiki/Threat_model

sourceArtifact A reference to an artifact containing the sources for a package.

staticAnalysisReport A reference to a static analysis report for a package.

support A reference to the software support channel or other support information for a package.

vcs A reference to a version control system related to a software artifact.

vulnerabilityDisclosureReport A reference to a Vulnerability Disclosure Report (VDR) which provides the software supplier's analysis and findings describing the impact (or lack of impact) that reported vulnerabilities have on packages or products in the supplier's SBOM as defined in NIST SP 800-161 Cybersecurity Supply Chain Risk Management Practices for Systems and Organizations³⁰.

vulnerabilityExploitabilityAssessment A reference to a Vulnerability Exploitability eXchange (VEX) statement which provides information on whether a product is impacted by a specific vulnerability in an included package and, if affected, whether there are actions recommended to remediate. See also NTIA VEX one-page summary³¹.

6.3.4 HashAlgorithm

Summary

A mathematical algorithm that maps data of arbitrary size to a bit string.

Description

A HashAlgorithm is a mathematical algorithm that maps data of arbitrary size to a bit string (the hash) and is a one-way function, that is, a function which is practically infeasible to invert.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/HashAlgorithm>

<i>Name:</i> HashAlgorithm

Entries

adler32 Adler-32 checksum is part of the widely used zlib compression library as defined in RFC 1950³² Section 2.3.

blake2b256 BLAKE2b algorithm with a digest size of 256, as defined in RFC 7693³³ Section 4.

blake2b384 BLAKE2b algorithm with a digest size of 384, as defined in RFC 7693³⁴ Section 4.

blake2b512 BLAKE2b algorithm with a digest size of 512, as defined in RFC 7693³⁵ Section 4.

- md2** MD2 message-digest algorithm, as defined in RFC 1319⁴⁰.
- md4** MD4 message-digest algorithm, as defined in RFC 1186⁴¹.
- md5** MD5 message-digest algorithm, as defined in RFC 1321⁴².
- md6** MD6 hash function⁴³
- other** any hashing algorithm that does not exist in this list of entries
- sha1** SHA-1, a secure hashing algorithm, as defined in RFC 3174⁴⁴.
- sha224** SHA-2 with a digest length of 224, as defined in RFC 3874⁴⁵.
- sha256** SHA-2 with a digest length of 256, as defined in RFC 6234⁴⁶.
- sha384** SHA-2 with a digest length of 384, as defined in RFC 6234⁴⁷.
- sha3_224** SHA-3 with a digest length of 224, as defined in FIPS 202⁴⁸.
- sha3_256** SHA-3 with a digest length of 256, as defined in FIPS 202⁴⁹.
- sha3_384** SHA-3 with a digest length of 384, as defined in FIPS 20250.
- sha3_512** SHA-3 with a digest length of 512, as defined in FIPS 2025¹.
- sha512** SHA-2 with a digest length of 512, as defined in RFC 6234⁵².

6.3.5 LifecycleScopeType

Summary

Provide an enumerated set of lifecycle phases that can provide context to relationships.

Description

This enumeration summarizes common phases when dependency and other relationships, have different implications, based on their context. For example, a build dependency, may have different implications than a operational dependency.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/LifecycleScopeType>

Name: LifecycleScopeType

Entries

build A relationship has specific context implications during an element's build phase, during development.

design A relationship has specific context implications during an element's design.

development A relationship has specific context implications during development phase of an element.

other A relationship has other specific context information necessary to capture that the above set of enumerations does not handle.

runtime A relationship has specific context implications during the execution phase of an element.

test A relationship has specific context implications during an element's testing phase, during development.

6.3.6 PresenceType

Summary

Categories of presence or absence.

Description

This type is used to indicate if a given field is present or absent or unknown.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/PresenceType>

<i>Name:</i> PresenceType

Entries

no Indicates absence of the field.

noAssertion Makes no assertion about the field.

yes Indicates presence of the field.

6.3.7 ProfileIdentifierType

Summary

Enumeration of the valid profiles.

Description

There are a set of profiles that have been defined by a profile team.

A profile consists of a namespace that may add properties and classes to the Core profile unique to the domain covered by the profile.

The profile may also contain additional restrictions on existing properties and classes defined in other profiles.

If the creator of an SPDX collection of elements includes a profile in the list of profileConformance, they are claiming that all contained elements conform to all restrictions defined for that profile.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/ProfileIdentifierType>

<i>Name:</i> ProfileIdentifierType

Entries

ai the element follows the AI profile specification

build the element follows the Build profile specification

core the element follows the Core profile specification

dataset the element follows the Dataset profile specification

expandedLicensing the element follows the ExpandedLicensing profile specification

extension the element follows the Extension profile specification

lite the element follows the Lite profile specification

security the element follows the Security profile specification

simpleLicensing the element follows the SimpleLicensing profile specification

software the element follows the Software profile specification

6.3.8 RelationshipCompleteness

Summary

Indicates whether a relationship is known to be complete, incomplete, or if no assertion is made with respect to relationship completeness.

Description

RelationshipCompleteness indicates whether the provided relationship is known to be complete, known to be incomplete, or if no assertion is made by the relationship creator.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/RelationshipCompleteness>

<i>Name:</i> RelationshipCompleteness

Entries

complete The relationship is known to be exhaustive.

incomplete The relationship is known not to be exhaustive.

noAssertion No assertion can be made about the completeness of the relationship.

6.3.9 RelationshipType

Summary

Information about the relationship between two Elements.

Description

Provides information about the relationship between two Elements. For example, you can represent a relationship between two different Files, between a Package and a File, between two Packages, or between one SpdxDocument and another SpdxDocument.

Relationship names should be descriptive enough to easily deduce the correct direction from their name. The best way to do this is to make sure that the relationship name completes the sentence:

from (is) (a) RELATIONSHIP to

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/RelationshipType>

<i>Name:</i> RelationshipType

Entries

affects The from Vulnerability affects each to Element. The use of the affects type is constrained to VexAffectedVulnAssessmentRelationship classed relationships.

amendedBy The from Element is amended by each to Element.

ancestorOf The from Element is an ancestor of each to Element.

availableFrom The from Element is available from the additional supplier described by each to Element.

configures The from Element is a configuration applied to each to Element, during a LifecycleScopeType period.

contains The from Element contains each to Element.

coordinatedBy The from Vulnerability is coordinatedBy the to Agent(s) (vendor, researcher, or consumer agent).

copiedTo The from Element has been copied to each to Element.

delegatedTo The from Agent is delegating an action to the Agent of the to Relationship (which must be of type invokedBy), during a LifecycleScopeType (e.g. the to invokedBy Relationship is being done on behalf of from).

dependsOn The from Element depends on each to Element, during a LifecycleScopeType period.

descendantOf The from Element is a descendant of each to Element.

describes The from Element describes each to Element. To denote the root(s) of a tree of elements in a collection, the rootElement property should be used.

doesNotAffect The from Vulnerability has no impact on each to Element. The use of the doesNotAffect is constrained to VexNotAffectedVulnAssessmentRelationship classed relationships.

expandsTo The from archive expands out as an artifact described by each to Element.

exploitCreatedBy The from Vulnerability has had an exploit created against it by each to Agent.

fixedBy Designates a from Vulnerability has been fixed by the to Agent(s).

fixedIn A from Vulnerability has been fixed in each to Element. The use of the fixedIn type is constrained to VexFixedVulnAssessmentRelationship classed relationships.

foundBy Designates a from Vulnerability was originally discovered by the to Agent(s).

generates The from Element generates each to Element.

hasAddedFile Every to Element is a file added to the from Element (from hasAddedFile to).

hasAssessmentFor Relates a from Vulnerability and each to Element with a security assessment. To be used with VulnAssessmentRelationship types.

hasAssociatedVulnerability Used to associate a from Artifact with each to Vulnerability.

hasConcludedLicense The from SoftwareArtifact is concluded by the SPDX data creator to be governed by each to license.

- hasDataFile** The `from` Element treats each `to` Element as a data file. A data file is an artifact that stores data required or optional for the `from` Element's functionality. A data file can be a database file, an index file, a log file, an AI model file, a calibration data file, a temporary file, a backup file, and more. For AI training dataset, test dataset, test artifact, configuration data, build input data, and build output data, please consider using the more specific relationship types: `trainedOn`, `testedOn`, `hasTest`, `configures`, `hasInput`, and `hasOutput`, respectively. This relationship does not imply dependency.
- hasDeclaredLicense** The `from` SoftwareArtifact was discovered to actually contain each `to` license, for example as detected by use of automated tooling.
- hasDeletedFile** Every `to` Element is a file deleted from the `from` Element (`from` `hasDeletedFile` `to`).
- hasDependencyManifest** The `from` Element has manifest files that contain dependency information in each `to` Element.
- hasDistributionArtifact** The `from` Element is distributed as an artifact in each `to` Element (e.g. an RPM or archive file).
- hasDocumentation** The `from` Element is documented by each `to` Element.
- hasDynamicLink** The `from` Element dynamically links in each `to` Element, during a `LifecycleScopeType` period.
- hasEvidence** Every `to` Element is considered as evidence for the `from` Element (`from` `hasEvidence` `to`).
- hasExample** Every `to` Element is an example for the `from` Element (`from` `hasExample` `to`).
- hasHost** The `from` Build was run on the `to` Element during a `LifecycleScopeType` period (e.g. the host that the build runs on).
- hasInput** The `from` Build has each `to` Element as an input, during a `LifecycleScopeType` period.
- hasMetadata** Every `to` Element is metadata about the `from` Element (`from` `hasMetadata` `to`).
- hasOptionalComponent** Every `to` Element is an optional component of the `from` Element (`from` `hasOptionalComponent` `to`).
- hasOptionalDependency** The `from` Element optionally depends on each `to` Element, during a `LifecycleScopeType` period.
- hasOutput** The `from` Build element generates each `to` Element as an output, during a `LifecycleScopeType` period.
- hasPrerequisite** The `from` Element has a prerequisite on each `to` Element, during a `LifecycleScopeType` period.
- hasProvidedDependency** The `from` Element has a dependency on each `to` Element, dependency is not in the distributed artifact, but assumed to be provided, during a `LifecycleScopeType` period.
- hasRequirement** The `from` Element has a requirement on each `to` Element, during a `LifecycleScopeType` period.
- hasSpecification** Every `to` Element is a specification for the `from` Element (`from` `hasSpecification` `to`), during a `LifecycleScopeType` period.
- hasStaticLink** The `from` Element statically links in each `to` Element, during a `LifecycleScopeType` period.
- hasTest** Every `to` Element is a test artifact for the `from` Element (`from` `hasTest` `to`), during a `LifecycleScopeType` period.
- hasTestCase** Every `to` Element is a test case for the `from` Element (`from` `hasTestCase` `to`).
- hasVariant** Every `to` Element is a variant the `from` Element (`from` `hasVariant` `to`).
- invokedBy** The `from` Element was invoked by the `to` Agent, during a `LifecycleScopeType` period (for example, a Build element that describes a build step).

modifiedBy The from Element is modified by each to Element.

other Every to Element is related to the from Element where the relationship type is not described by any of the SPDX relationship types (this relationship is directionless).

packagedBy Every to Element is a packaged instance of the from Element (from packagedBy to).

patchedBy Every to Element is a patch for the from Element (from patchedBy to).

publishedBy Designates a from Vulnerability was made available for public use or reference by each to Agent.

reportedBy Designates a from Vulnerability was first reported to a project, vendor, or tracking database for formal identification by each to Agent.

republishedBy Designates a from Vulnerability's details were tracked, aggregated, and/or enriched to improve context (i.e. NVD) by each to Agent.

serializedInArtifact The from SpdxDocument can be found in a serialized form in each to Artifact.

testedOn The from Element has been tested on the to Element(s).

trainedOn The from Element has been trained on the to Element(s).

underInvestigationFor The from Vulnerability impact is being investigated for each to Element. The use of the underInvestigationFor type is constrained to VexUnderInvestigationVulnAssessmentRelationship classed relationships.

usesTool The from Element uses each to Element as a tool, during a LifecycleScopeType period.

6.3.10 SupportType

Summary

Indicates the type of support that is associated with an artifact.

Description

SupportType is an enumeration of the various types of support commonly found for artifacts in the software supply chain. Specific details of what that support entails are provided by agreements between the producer and consumer of the artifact.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/SupportType>

Name:	SupportType
-------	-------------

Entries

deployed in addition to being supported by the supplier, the software is known to have been deployed and is in use. For a software as a service provider, this implies the software is now available as a service.

development the artifact is in active development and is not considered ready for formal support from the supplier.

endOfSupport there is a defined end of support for the artifact from the supplier. This may also be referred to as end of life. There is a validUntilDate that can be used to signal when support ends for the artifact.

limitedSupport the artifact has been released, and there is limited support available from the supplier. There is a validUntilDate that can provide additional information about the duration of support.

noAssertion no assertion about the type of support is made. This is considered the default if no other support type is used.

noSupport there is no support for the artifact from the supplier, consumer assumes any support obligations.

support the artifact has been released, and is supported from the supplier. There is a validUntilDate that can provide additional information about the duration of support.

6.4 Individuals

6.4.1 NoAssertionElement

Summary

An Individual Value for Element representing a set of Elements of unknown identify or cardinality (number).

Description

NoAssertionElement should be used if

- the SPDX creator has attempted to but cannot reach a reasonable objective determination;
- the SPDX creator has made no attempt to determine this field; or
- the SPDX creator has intentionally provided no information (no meaning should be implied by doing so).

For example, a Relationship with `relationshipType="ancestorOf"`, `from=Element1`, and `to=NoAssertionElement` is explicitly expressing that no assertion is being made about any potential descendants of Element1.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/NoAssertionElement>

<i>Name:</i>	NoAssertionElement
<i>Type:</i>	IndividualElement
<i>IRI:</i>	https://spdx.org/rdf/3.0.1/terms/Core/NoAssertionElement

6.4.2 NoneElement

Summary

An Individual Value for Element representing a set of Elements with cardinality (number/count) of zero.

Description

NoneElement should be used if the SPDX creator desires to assert that there are NO elements for the given context of use.

For example, a Relationship with `relationshipType="ancestorOf"`, `from=Element1`, and `to=NoneElement` is explicitly expressing an assertion that Element1 has no descendants.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/NoneElement>

<i>Name:</i>	NoneElement
<i>Type:</i>	IndividualElement
<i>IRI:</i>	https://spdx.org/rdf/3.0.1/terms/Core/NoneElement

6.4.3 SpdxOrganization

Summary

An Organization representing the SPDX Project.

Description

SpdxOrganization is an Organization representing the SPDX Project. It is by definition the creator of all Element type individuals defined by the SPDX Project. These individuals include licences and exceptions defined in the SPDX License List, as well as individuals defined in the specification.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/SpdxOrganization>

<i>Name:</i>	SpdxOrganization
<i>Type:</i>	Organization
<i>IRI:</i>	https://spdx.org/

6.5 Datatypes

6.5.1 DateTime

Summary

A string representing a specific date and time.

Description

A DateTime is a string representation of a specific date and time.

It has resolution of seconds and is always expressed in UTC time zone.

The specific format is one of the most commonly used ISO-8601 formats.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/DateTime>

<i>Name:</i>	DateTime
<i>SubclassOf:</i>	xsd:dateTimeStamp

Format pattern

`^\d\d\d\d-\d\d-\d\dT\d\d:\d\d:\d\dZ$`

6.5.2 MediaType

Summary

Standardized way of indicating the type of content of an Element or a Property. A String constrained to the RFC 2046 specification.

Description

A MediaType is a string constrained to the RFC 2046 MIME Part Two: Media Types⁵. It provides a standardized way of indicating the type of content of an Element or a Property.

Example

- application/java-archive
- application/vcard+json
- application/vnd.oasis.opendocument.text
- image/avif
- text/csv; charset=UTF-8

⁵<https://datatracker.ietf.org/doc/rfc2046/>

- text/javascript
- text/spdx

A list of all possible media types is available at IANA Protocol Registries⁵⁴.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/MediaType>

<i>Name:</i>	MediaType
<i>SubclassOf:</i>	xsd:string

Format pattern

`^[^\\/] + \\/ [^\\/] + $`

6.5.3 SemVer

Summary

A string constrained to the SemVer 2.0.0 specification.

Description

A semantic version is a string that is following the specification of Semantic Versioning 2.0.055.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Core/SemVer>

<i>Name:</i>	SemVer
<i>SubclassOf:</i>	xsd:string

Format pattern

`^(0|[1-9]\d*)\.(0|[1-9]\d*)\.(0|[1-9]\d*)(?:-((?:0|[1-9]\d*|\d*[a-zA-Z-][0-9a-zA-Z-]*)?(?:\.(?:0|[1-9]\d*)?)))?$`

7 Software

Summary

Everything having to do with software.

Description

The Software namespace defines concepts related to software artifacts.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software>

<i>Name:</i>	Software
--------------	----------

⁵⁴<https://www.iana.org/assignments/media-types/media-types.xhtml>

⁵⁵<https://semver.org/>

7.1 Classes

7.1.1 ContentIdentifier

Summary

A canonical, unique, immutable identifier

Description

A ContentIdentifier is a canonical, unique, immutable identifier of the content of a software artifact, such as a package, a file, or a snippet.

It can be used for verifying its identity and integrity.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/ContentIdentifier>

<i>Name:</i>	ContentIdentifier

7.1.2 File

Summary

Refers to any object that stores content on a computer.

Description

Refers to any object that stores content on a computer. The type of content can optionally be provided in the content-Type property.

The fileKind property can be set to `directory` to indicate the file represents a directory and all content stored in that directory.

Metadata

7.1.3 Package

Summary

Refers to any unit of content that can be associated with a distribution of software.

Description

A package refers to any unit of content that can be associated with a distribution of software.

Typically, a package is composed of one or more files.

Any of the following non-limiting examples may be (but are not required to be) represented in SPDX as a package:

- a tarball, zip file or other archive
- a directory or sub-directory
- a separately distributed piece of software which another Package or File uses or depends upon (e.g., a Python package, a Go module, ...)
- a container image, and/or each image layer within a container image
- a collection of one or more sub-packages
- a Git repository snapshot from a particular point in time

Note that some of these could be represented in SPDX as a file as well.

7.1.4 S bom

Summary

A collection of SPDX Elements describing a single package.

Description

A Software Bill of Materials (SBOM) is a collection of SPDX Elements describing a single package.

This could include details of the content and composition of the product, provenance details of the product and/or its composition, licensing information, known quality or security issues, etc.

Metadata

7.1.5 Snippet

Summary

Describes a certain part of a file.

Description

A Snippet describes a certain part of a file and can be used when the file is known to have some content that has been included from another original source.

Snippets are useful for denoting when part of a file may have been originally created under another license or copied from a place with a known vulnerability.

7.2 Properties

7.2.1 additionalPurpose

Summary

Provides additional purpose information of the software artifact.

Description

An additionalPurpose provides information about the additional purpose of the software artifact in addition to the primaryPurpose.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/additionalPurpose>

<i>Name:</i>	additionalPurpose
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	SoftwarePurpose

Referenced

- /Software/SoftwareArtifact

7.2.2 attributionText**Summary**

Provides a place for the SPDX data creator to record acknowledgement text for a software Package, File or Snippet.

Description

An attributionText for a software Package, File or Snippet provides a consumer of SPDX data with acknowledgement content, to assist redistributors of the Package, File or Snippet with reproducing those acknowledgements.

For example, this field may include a statement that is required by a particular license to be reproduced in end-user documentation, advertising materials, or another form.

This field may describe where, or in which contexts, the acknowledgements need to be reproduced, but it is not required to do so. The SPDX data creator may also explain elsewhere (such as in a comment field) how they intend for data in this field to be used.

An attributionText is not meant to include the software Package, File or Snippet's actual complete license text. Use hasConcludedLicense to identify the corresponding license.

- /Software/SoftwareArtifact

7.2.3 byteRange**Summary**

Defines the byte range in the original host file that the snippet information applies to.

Description

This field defines the byte range in the original host file that the snippet information applies to.

A range of bytes is independent of various formatting concerns, and the most accurate way of referring to the differences. The choice was made to start the numbering of the byte range at 1 to be consistent with the W3C pointer method vocabulary.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/byteRange>

<i>Name:</i>	byteRange
<i>Nature:</i>	DataProperty
<i>Range:</i>	/Core/PositiveIntegerRange

7.2.4 contentIdentifier

Summary

A canonical, unique, immutable identifier of the artifact content, that may be used for verifying its identity and/or integrity.

Description

A contentIdentifier is a canonical, unique, immutable identifier of the content of a software artifact, such as a package, a file, or a snippet.

It may be used for verifying its identity and/or integrity.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/contentIdentifier>

<i>Name:</i>	contentIdentifier
<i>Nature:</i>	DataProperty
<i>Range:</i>	ContentIdentifier

- /Software/ContentIdentifier

7.2.6 contentIdentifierValue

Summary

Specifies the value of the content identifier.

Description

A contentIdentifierValue specifies the value of a content identifier.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/contentIdentifierValue>

<i>Name:</i>	contentIdentifierValue
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:anyURI

Referenced

- /Software/ContentIdentifier

7.2.7 copyrightText**Summary**

Identifies the text of one or more copyright notices for a software Package, File or Snippet, if any.

Description

A copyrightText consists of the text(s) of the copyright notice(s) found for a software Package, File or Snippet, if any.

If a copyrightText contains text, then it may contain any text related to one or more copyright notices (even if not complete) for that software Package, File or Snippet.

If a copyrightText has a “NONE” value, this indicates that the software Package, File or Snippet contains no copyright notice whatsoever.

If a copyrightText has a “NOASSERTION” value, this indicates that one of the following applies:

- the SPDX data creator has attempted to but cannot reach a reasonable objective determination;
- the SPDX data creator has made no attempt to determine this field; or
- the SPDX data creator has intentionally provided no information (no meaning should be implied by doing so).

If a copyrightText is present, but consists of solely an empty string or a string with no substantive content (e.g., a string that contains only whitespace), then this should be interpreted as equivalent to a “NOASSERTION” value as described above.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/copyrightText>

<i>Name:</i>	copyrightText
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

- /Software/SoftwareArtifact

7.2.8 downloadLocation**Summary**

Identifies the download Uniform Resource Identifier for the package at the time that the document was created.

Description

A downloadLocation identifies the download Uniform Resource Identifier for the package at the time that the document was created.

Where and how to download the exact package being referenced is critical for verification and tracking data.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/downloadLocation>

<i>Name:</i>	downloadLocation
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:anyURI

Referenced

- /Software/Package

7.2.9 fileKind**Summary**

Describes if a given file is a directory or non-directory kind of file.

Description

An SPDX file may represent a specific file or a directory of files.

In the future, this may be extended to other kinds (e.g. network based files).

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/fileKind>

<i>Name:</i>	fileKind
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	FileKindType

- /Software/File

7.2.10 homePage**Summary**

A place for the SPDX document creator to record a website that serves as the package's home page.

Description

A homePage is a place for the SPDX document creator to record a website that serves as the package's home page.

This saves the recipient of the SPDX document who is looking for more info from having to search for and verify a match between the package and the associated project home page.

This link can also be used to reference further information about the package referenced by the SPDX document creator.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/homePage>

<i>Name:</i>	homePage
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:anyURI

Referenced

- /Software/Package

7.2.11 lineRange**Summary**

Defines the line range in the original host file that the snippet information applies to.

Description

This field defines the line range in the original host file that the snippet information applies to.

If there is a disagreement between the byte range and line range, the byte range values will take precedence.

A range of lines is a convenient reference for those files where there is a known line delimiter. The choice was made to start the numbering of the lines at 1 to be consistent with the W3C pointer method vocabulary.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/lineRange>

<i>Name:</i>	lineRange
<i>Nature:</i>	DataProperty
<i>Range:</i>	/Core/PositiveIntegerRange

Referenced

- /Software/Snippet

7.2.12 packageUrl**Summary**

Provides a place for the SPDX data creator to record the package URL string (in accordance with the Package URL specification) for a software Package.

Description

A package URL (commonly pronounced and referred to as “purl”) is an attempt to standardize package representations in order to reliably identify and locate software packages. A packageUrl is a URL string which represents a package in a mostly universal and uniform way across programming languages, package managers, packaging conventions, tools, APIs and databases.

A packageUrl is composed of seven components:

```
scheme:type/namespace/name@version?qualifiers#subpath
```

The definition for each component can be found in the corresponding Annex56 of this specification. Known type definitions can be found in the Package URL type definitions57.

Components are designed such that they form a hierarchy from the most significant on the left to the least significant components on the right.

56./../annexes/pkg-url-specification.md

7.2.17 sourceInfo**Summary**

Records any relevant background information or additional comments about the origin of the package.

Description

A sourceInfo records any relevant background information or additional comments about the origin of the package.

For example, this field might include comments indicating whether the package was pulled from a source code management system or has been repackaged.

The creator can provide additional information to describe any anomalies or discoveries in the determination of the origin of the package.

7.3 Vocabularies

7.3.1 ContentIdentifierType

Summary

Specifies the type of a content identifier.

Description

ContentIdentifierType specifies the type of a content identifier.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/ContentIdentifierType>

<i>Name:</i>	ContentIdentifierType
--------------	-----------------------

Entries

gitoid Gitoid⁵⁹, stands for Git Object ID⁶⁰. A gitoid of type blob is a unique hash of a binary artifact. A gitoid may represent either an Artifact Identifier⁶¹ for the software artifact or an Input Manifest Identifier⁶² for the software artifact's associated Artifact Input Manifest⁶³; this ambiguity exists because the Artifact Input Manifest is itself an artifact, and the gitoid of that artifact is its valid identifier. Gitoids calculated on software artifacts (Snippet, File, or Package Elements) should be recorded in the SPDX 3.0 SoftwareArtifact's contentIdentifier property. Gitoids calculated on the Artifact Input Manifest (Input Manifest Identifier) should be recorded in the SPDX 3.0 Element's externalIdentifier property. See OmniBOR Specification⁶⁴, a minimalistic specification for describing software Artifact Dependency Graphs⁶⁵.

swhid SoftWare Hash IDentifier, a persistent intrinsic identifier for digital artifacts, such as files, trees (also known as directories or folders), commits, and other objects typically found in version control systems. The format of the identifiers is defined in the SWHID specification⁶⁶ (ISO/IEC DIS 18670). They typically look like `swh:1:cnt:94a9ed024d3859793618152ea559a168bbcbb5e2`.

7.3.2 FileKindType

Summary

Enumeration of the different kinds of SPDX file.

In the future, this may be extended to other kinds (e.g. network based files).

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/FileKindType>

Name: FileKindType

Entries

directory The file represents a directory and all content stored in that directory.

file The file represents a single file (default).

7.3.3 S bomType

Summary

Provides a set of values to be used to describe the common types of SBOMs that tools may create.

Description

The set of SBOM types with definitions as defined in Types of Software Bill of Material (SBOM) Documents⁶⁷, published on April 21, 2023.

An SBOM type describes the most likely type of an SBOM from the producer perspective, so that consumers can draw conclusions about the data inside an SBOM.

A single SBOM can have multiple SBOM document types associated with it.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/SbomType>

Name: SbomType

Entries

analyzed SBOM generated through analysis of artifacts (e.g., executables, packages, containers, and virtual machine images) after its build. Such analysis generally requires a variety of heuristics. In some contexts, this may also be referred to as a “3rd party” SBOM.

build SBOM generated as part of the process of building the software to create a releasable artifact (e.g., executable or package) from data such as source files, dependencies, built components, build process ephemeral data, and other SBOMs.

deployed SBOM provides an inventory of software that is present on a system. This may be an assembly of other SBOMs that combines analysis of configuration options, and examination of execution behavior in a (potentially simulated) deployment environment.

design SBOM of intended, planned software project or product with included components (some of which may not yet exist) for a new software artifact.

runtime SBOM generated through instrumenting the system running the software, to capture only components present in the system, as well as external call-outs or dynamically loaded components. In some contexts, this may also be referred to as an “Instrumented” or “Dynamic” SBOM.

⁶⁷<https://www.cisa.gov/sites/default/files/2023-04/sbom-types-document-508c.pdf>

source SBOM created directly from the development environment, source files, and included dependencies used to build an product artifact.

7.3.4 SoftwarePurpose

Summary

Provides information about the primary purpose of an Element.

Description

This field provides information about the primary purpose of an Element.

Software Purpose is intrinsic to how the Element is being used rather than the content of the Element.

This field is a reasonable estimate of the most likely usage of the Element from the producer and consumer perspective from which both parties can draw conclusions about the context in which the Element exists.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Software/SoftwarePurpose>

Name: SoftwarePurpose

Entries

application The Element is a software application.

archive The Element is an archived collection of one or more files (.tar, .zip, etc.).

bom The Element is a bill of materials.

configuration The Element is configuration data.

container The Element is a container image which can be used by a container runtime application.

data The Element is data.

device The Element refers to a chipset, processor, or electronic board.

deviceDriver The Element represents software that controls hardware devices.

diskImage The Element refers to a disk image that can be written to a disk, booted in a VM, etc. A disk image typically contains most or all of the components necessary to boot, such as bootloaders, kernels, firmware, userspace, etc.

documentation The Element is documentation.

evidence The Element is the evidence that a specification or requirement has been fulfilled.

executable The Element is an Artifact that can be run on a computer.

file The Element is a single file which can be independently distributed (configuration file, statically linked binary, Kubernetes deployment, etc.).

filesystemImage The Element is a file system image that can be written to a disk (or virtual) partition.

firmware The Element provides low level control over a device's hardware.

framework The Element is a software framework.

install The Element is used to install software on disk.

library The Element is a software library.

manifest The Element is a software manifest.

model The Element is a machine learning or artificial intelligence model.

module The Element is a module of a piece of software.

operatingSystem The Element is an operating system.

other The Element doesn't fit into any of the other categories.

patch The Element contains a set of changes to update, fix, or improve another Element.

platform The Element represents a runtime environment.

requirement The Element provides a requirement needed as input for another Element.

source The Element is a single or a collection of source files.

specification The Element is a plan, guideline or strategy how to create, perform or analyze an application.

test The Element is a test used to verify functionality on an software element.

8 Security

8.1 Classes

8.1.1 CvssV2VulnAssessmentRelationship

Summary

Provides a CVSS version 2.0 assessment for a vulnerability.

Description

A CvssV2VulnAssessmentRelationship relationship describes the determined score and vector of a vulnerability as defined in A Complete Guide to the Common Vulnerability Scoring System Version 2.068.

It is intended to communicate the results of using a CVSS calculator.

Constraints

- The relationship type must be set to hasAssessmentFor.

Example

8.1.2 CvssV3VulnAssessmentRelationship

Summary

Provides a CVSS version 3 assessment for a vulnerability.

Description

A CvssV3VulnAssessmentRelationship relationship describes the determined score, severity, and vector of a vulnerability as defined in Common Vulnerability Scoring System v3.0: Specification Document⁶⁹ or Common Vulnerability Scoring System v3.1: Specification Document⁷⁰.

It is intended to communicate the results of using a CVSS calculator.

Constraints

- The relationship type must be set to hasAssessmentFor.

Example

```

8.1.3 CvssV4VulnAssessmentRelationship

Summary

Provides a CVSS version 4 assessment for a vulnerability.

Description

A CvssV4VulnAssessmentRelationship relationship describes the determined score, severity, and vector of a vulnerability as defined in Common Vulnerability Scoring System version 4.0: Specification Document⁷.

It is intended to communicate the results of using a CVSS calculator.

Constraints

- The relationship type must be set to hasAssessmentFor.

Example

```
{
  "type": "CvssV4VulnAssessmentRelationship",
  "spdxId": "urn:spdx.dev:cvssv4-cve-2021-44228",
  "relationshipType": "hasAssessmentFor",
  "security_severity": "medium",
  "security_score": "10.0",

8.1.4 EpassVulnAssessmentRelationship

Summary

Provides an EPSS assessment for a vulnerability.

Description

An EpassVulnAssessmentRelationship relationship describes the likelihood or probability that a vulnerability will be exploited in the wild, and the percentile ranking of probability relative to all other vulnerabilities' EPSS scores, using the Exploit Prediction Scoring System (EPSS) as defined at The EPSS Model⁷².

Constraints

- The relationship type must be set to hasAssessmentFor.
- The probability must be between 0 and 1.
- The percentile must be between 0 and 1.

Example

```
{
  "type": "EpassVulnAssessmentRelationship",
  "spdxId": "urn:spdx.dev:epss-CVE-2020-28498",
  "relationshipType": "hasAssessmentFor",
  "security_probability": "0.00105",
  "security_percentile": "0.42356",
  "from": "urn:spdx.dev:vuln-cve-2020-28498",
```

⁷²<https://www.first.org/epss/model>

```

    "to": ["urn:product-acme-application-1.3"],
    "suppliedBy": ["urn:spdx.dev:agent-jane-doe"],
    "publishedTime": "2023-10-05T00:00:30Z"
}

```

8.1.5 ExploitCatalogVulnAssessmentRelationship

Summary

Provides an exploit assessment of a vulnerability.

Description

An ExploitCatalogVulnAssessmentRelationship describes if a vulnerability is listed in any exploit catalog such as the CISA Known Exploited Vulnerabilities (KEV) Catalog⁷³.

Constraints

- The relationship type must be set to hasAssessmentFor.

Example

```
{
  "type": "ExploitCatalogVulnAssessmentRelationship",
  "spdxId": "urn:spdx.dev:exploit-catalog-1",
  "relationshipType": "hasAssessmentFor",
  "security_catalogType": "kev",
  "locator": "https://www.cisa.gov/known-exploited-vulnerabilities-catalog",
  "security_exploited": "true",
  "from": "urn:spdx.dev:vuln-cve-2023-2136",
  "to": ["urn:product-google-chrome-112.0.5615.136"],
  "suppliedBy": ["urn:spdx.dev:agent-jane-doe"],
  "publishedTime": "2021-03-09T11:04:53Z"
}
```

8.1.6 SsvcVulnAssessmentRelationship

Summary

Provides an Ssvc assessment for a vulnerability.

Description

An SsvcVulnAssessmentRelationship describes the decision made using the Stakeholder-Specific Vulnerability Categorization (SSVC) decision tree as defined by CISA Stakeholder-Specific Vulnerability Categorization Guide⁷⁴.

It is intended to communicate the results of using the CISA Ssvc Calculator.

Constraints

- The relationship type must be set to hasAssessmentFor.

Example

```
{
  "@type": "SsvcVulnAssessmentRelationship",
  "@id": "urn:spdx.dev:ssvc-1",
  "relationshipType": "hasAssessmentFor",
  "security_decisionType": "act",
  "from": "urn:spdx.dev:vuln-cve-2020-28498",
  "to": ["urn:product-acme-application-1.3"],
  "security_assessedElement": "urn:npm-elliptic-6.5.2",
  "suppliedBy": ["urn:spdx.dev:agent-jane-doe"],
  "publishedTime": "2021-03-09T11:04:53Z"
}

8.1.7 VexAffectedVulnAssessmentRelationship

Summary

Connects a vulnerability and an element designating the element as a product affected by the vulnerability.

Description

VexAffectedVulnAssessmentRelationship connects a vulnerability and a number of elements. The relationship marks these elements as products affected by the vulnerability. This relationship corresponds to the VEX affected status.

Constraints

When linking elements using a `VexAffectedVulnAssessmentRelationship`, the following requirements must be observed:

- Elements linked with a `VulnVexAffectedAssessmentRelationship` are constrained to the `affects` relationship type.

Example

```
{
  "type": "VexAffectedVulnAssessmentRelationship",
  "spdxId": "urn:spdx.dev:vex-affected-1",
  "relationshipType": "affects",
  "from": "urn:spdx.dev:vuln-cve-2020-28498",
  "to": ["urn:product-acme-application-1.3"],
  "security_assessedElement": "urn:npm-elliptic-6.5.2",
  "security_actionStatement": "Upgrade to version 1.4 of ACME application.",
  "suppliedBy": ["urn:spdx.dev:agent-jane-doe"],
  "publishedTime": "2021-03-09T11:04:53Z"
}
```

8.1.8 VexFixedVulnAssessmentRelationship

Summary

Links a vulnerability and elements representing products (in the VEX sense) where a fix has been applied and are no longer affected.

Description

VexFixedVulnAssessmentRelationship links a vulnerability to a number of elements representing VEX products where a vulnerability has been fixed and are no longer affected. It represents the VEX fixed status.

Constraints

When linking elements using a VexFixedVulnAssessmentRelationship, the following requirements must be observed:

- Elements linked with a VulnVexFixedAssessmentRelationship are constrained to using the fixedIn relationship type.
- The from: end of the relationship must be a /Security/Vulnerability classed element.

Example

```
{
  "type": "VexFixedVulnAssessmentRelationship",
  "spdxId": "urn:spdx.dev:vex-fixed-in-1",
  "relationshipType": "fixedIn",
  "from": "urn:spdx.dev:vuln-cve-2020-28498",
  "to": ["urn:product-acme-application-1.3"],
```

```

"security_assessedElement": "urn:npm-elliptic-6.5.4",
"suppliedBy": ["urn:spdx.dev:agent-jane-doe"],
"publishedTime": "2021-03-09T11:04:53Z"
}
    
```

8.1.9 VexNotAffectedVulnAssessmentRelationship

Summary

Links a vulnerability and one or more elements designating the latter as products not affected by the vulnerability.

Description

VexNotAffectedVulnAssessmentRelationship connects a vulnerability and a number of elements designating them as products not affected by the vulnerability. This relationship corresponds to the VEX not_affected status.

Constraints

When linking elements using a `VexNotVulnAffectedAssessmentRelationship`, the following requirements must be observed:

- Relating elements with a `VexNotAffectedVulnAssessmentRelationship` is restricted to the `doesNotAffect` relationship type.
- The `from`: end of the relationship must be a `/Security/Vulnerability` classed element.
- Both `impactStatement` and `justificationType` properties have a cardinality of 0..1 making them optional. Nevertheless, to produce a valid VEX `not_affected` statement, one of them **MUST** be defined. This is specified in the Minimum Elements for VEX.

Example

```
{
  "type": "VexNotAffectedVulnAssessmentRelationship",
  "spdxId": "urn:spdx.dev:vex-not-affected-1",
  "relationshipType": "doesNotAffect",
  "from": "urn:spdx.dev:vuln-cve-2020-28498",
  "to": ["urn:product-acme-application-1.3"],
  "security_assessedElement": "urn:npm-elliptic-6.5.2",
  "security_justificationType": "componentNotPresent",
  "security_impactStatement": "Not using this vulnerable part of this library.",
  "suppliedBy": ["urn:spdx.dev:agent-jane-doe"],
  "publishedTime": "2021-03-09T11:04:53Z"
}
```

8.1.10 VexUnderInvestigationVulnAssessmentRelationship

Summary

Designates elements as products where the impact of a vulnerability is being investigated.

Description

VexUnderInvestigationVulnAssessmentRelationship links a vulnerability to a number of products stating the vulnerability’s impact on them is being investigated. It represents the VEX under_investigation status.

Constraints

When linking elements using a VexUnderInvestigationVulnAssessmentRelationship the following requirements must be observed:

- Elements linked with a VexUnderInvestigationVulnAssessmentRelationship are constrained to using the underInvestigationFor relationship type.
- The from: end of the relationship must be a /Security/Vulnerability classed element.

Example

```
{
  "type": "VexUnderInvestigationVulnAssessmentRelationship",
  "spdxId": "urn:spdx.dev:vex-underInvestigation-1",
  "relationshipType": "underInvestigationFor",
  "from": "urn:spdx.dev:vuln-cve-2020-28498",
```

8.1.11 VexVulnAssessmentRelationship

Summary

Abstract ancestor class for all VEX relationships

Description

VexVulnAssessmentRelationship is an abstract subclass that defined the common properties shared by all the SPDX-VEX status relationships.

Constraints

When linking elements using a `VexVulnAssessmentRelationship`, the following requirements must be observed:

- The from: end must be a `/Security/Vulnerability` classed element
- The to: end must point to elements representing the VEX *products*.

To specify a different element where the vulnerability was detected, the VEX relationship can optionally specify *sub-components* using the `assessedElement` property.

VEX inherits information from the document level down to its statements. When a statement is missing information it can be completed by reading the equivalent field from the containing document. For example, if a VEX relationship is missing data in its `createdBy` property, tools must consider the entity listed in the `CreationInfo` section of the document as the VEX author. In the same way, when a VEX relationship does not have a `created` property, the document's date must be considered as authoritative.

8.1.12 VulnAssessmentRelationship

Summary

Abstract ancestor class for all vulnerability assessments

Description

VulnAssessmentRelationship is the ancestor class common to all vulnerability assessment relationships. It factors out the common properties shared by them.

Metadata

8.2 Properties

8.2.1 actionStatement

Summary

Provides advise on how to mitigate or remediate a vulnerability when a VEX product is affected by it.

Description

When an element is referenced with a VexAffectedVulnAssessmentRelationship, the relationship MUST include one actionStatement that SHOULD describe actions to remediate or mitigate the vulnerability.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/actionStatement>

<i>Name:</i>	actionStatement
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Security/VexAffectedVulnAssessmentRelationship

8.2.2 actionStatementTime**Summary**

Records the time when a recommended action was communicated in a VEX statement to mitigate a vulnerability.

Description

When a VEX statement communicates an affected status, the author **MUST** include an action statement with a recommended action to help mitigate the vulnerability's impact. The actionStatementTime property records the time when the action statement was first communicated.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/actionStatementTime>

<i>Name:</i>	actionStatementTime
<i>Nature:</i>	DataProperty
<i>Range:</i>	/Core/DateTime

Referenced

- /Security/VexAffectedVulnAssessmentRelationship

8.2.3 assessedElement**Summary**

Specifies an Element contained in a piece of software where a vulnerability was found.

Description

Specifies subpackages, files or snippets referenced by a security assessment to specify the precise location where a vulnerability was found.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/assessedElement>

<i>Name:</i>	assessedElement
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	/Software/SoftwareArtifact

Referenced

- /Security/VulnAssessmentRelationship

8.2.4 catalogType

Summary

Specifies the exploit catalog type.

Description

A catalogType is a mandatory value and must select one of the existing entries in the ExploitCatalogType⁷⁵ vocabulary.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/catalogType>

<i>Name:</i>	catalogType
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	ExploitCatalogType

Referenced

- /Security/ExploitCatalogVulnAssessmentRelationship

8.2.5 decisionType

Summary

Provide the enumeration of possible decisions in the [Stakeholder-Specific Vulnerability Categorization (SSVC) decision tree](<https://www.cisa.gov/stakeholder-specific-vulnerability-categorization-ssvc>).

Description

A decisionType is a mandatory value and must select one of the four entries in the SsvcDecisionType⁷⁶ vocabulary.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/decisionType>

<i>Name:</i>	decisionType
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	SsvcDecisionType

Referenced

- /Security/SsvcVulnAssessmentRelationship

8.2.6 exploited

Summary

Describe that a CVE is known to have an exploit because it's been listed in an exploit catalog.

Description

This field is set when a CVE is listed in an exploit catalog.

⁷⁵../Vocabularies/ExploitCatalogType.md

⁷⁶../Vocabularies/SsvcDecisionType.md

Metadata

8.2.7 impactStatement**Summary**

Explains why a VEX product is not affected by a vulnerability. It is an alternative in VexNotAffectedVulnAssessmentRelationship to the machine-readable justification label.

Description

When a VEX product element is related with a VexNotAffectedVulnAssessmentRelationship and a machine readable justification label is not provided, then an impactStatement that further explains how or why the product(s) are not affected by the vulnerability must be provided.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/impactStatement>

<i>Name:</i>	impactStatement
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Security/VexNotAffectedVulnAssessmentRelationship

8.2.8 impactStatementTime**Summary**

Timestamp of impact statement.

Description

Specifies the time when the impact statement was recorded.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/impactStatementTime>

<i>Name:</i>	impactStatementTime
<i>Nature:</i>	DataProperty
<i>Range:</i>	/Core/DateTime

Referenced

- /Security/VexNotAffectedVulnAssessmentRelationship

8.2.9 justificationType

Summary

Impact justification label to be used when linking a vulnerability to an element representing a VEX product with a VexNotAffectedVulnAssessmentRelationship relationship.

Description

When stating that an element is not affected by a vulnerability, the VexNotAffectedVulnAssessmentRelationship must include a justification from the machine-readable labels catalog informing the reason the element is not impacted.

impactStatement which is a string with English prose can be used instead or as complementary to the justification label, but one of both MUST be defined.

Metadata

- /Security/Vulnerability

8.2.12 percentile**Summary**

The percentile of the current probability score.

Description

The percentile between 0 and 1 (0 and 100%) of the current probability score, the proportion of all scored vulnerabilities with the same or a lower probability score. The definition follows “percentile” in EPSS Data77.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/percentile>

<i>Name:</i>	percentile
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:decimal

Referenced

- /Security/EpssVulnAssessmentRelationship

8.2.13 probability**Summary**

A probability score between 0 and 1 of a vulnerability being exploited.

Description

The probability score between 0 and 1 (0 and 100%) estimating the likelihood of exploitation in the wild in the next 30 days (following score publication). The definition follows “epss” in EPSS Data78.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/probability>

8.2.18 vectorString**Summary**

Specifies the CVSS vector string for a vulnerability.

Description

Specifies any combination of the CVSS Base, Temporal, Threat, Environmental, and/or Supplemental vector string values for a vulnerability.

Supports vectorStrings specified in all CVSS versions.

Constraints

String values for the vectorString range must only include the abbreviated form of metric names specified in CVSS specifications, e.g. Common Vulnerability Scoring System Vector String80.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/vectorString>

<i>Name:</i>	vectorString
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

- /Security/Vulnerability

8.3 Vocabularies**8.3.1 CvssSeverityType****Summary**

Specifies the CVSS base, temporal, threat, or environmental severity type.

Description

`CvssSeverityType` specifies the Common Vulnerability Scoring System (CVSS) severity type, defined in the CVSS specifications as the textual representation of the numeric CVSS score.

The severity type entries are inclusive of and applicable to enumerations found in Common Vulnerability Scoring System v3.0: Specification Document⁸¹ and Common Vulnerability Scoring System version 4.0: Specification Document⁸².

`CvssSeverityType` is a mandatory field because `baseSeverity` is required in the CVSS 3.0 schema⁸³, CVSS 3.1 schema⁸⁴, and CVSS 4.0 schema⁸⁵.

The field can be used to document the base, temporal, threat, or environmental severity.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/CvssSeverityType>

<i>Name:</i> <code>CvssSeverityType</code>
--

Entries

critical When a CVSS score is between 9.0 - 10.0

high When a CVSS score is between 7.0 - 8.9

low When a CVSS score is between 0.1 - 3.9

medium When a CVSS score is between 4.0 - 6.9

none When a CVSS score is 0.0

8.3.2 ExploitCatalogType

Summary

Specifies the exploit catalog type.

Description

`ExploitCatalogType` specifies the type of exploit catalog that a vulnerability is listed in.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/ExploitCatalogType>

<i>Name:</i> <code>ExploitCatalogType</code>
--

Entries

kev CISA's Known Exploited Vulnerability (KEV) Catalog

⁸⁵<https://www.first.org/cvss/cvss-v4.0.json>

8.3.3 SsvcDecisionType

Summary

Specifies the Ssvc decision type.

Description

SsvcDecisionType specifies the type of decision that's been made according to the Stakeholder-Specific Vulnerability Categorization (SSVC)⁸⁶.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/SsvcDecisionType>

Name: SsvcDecisionType

Entries

act The vulnerability requires attention from the organization's internal, supervisory-level and leadership-level individuals. Necessary actions include requesting assistance or information about the vulnerability, as well as publishing a notification either internally and/or externally. Typically, internal groups would meet to determine the overall response and then execute agreed upon actions. CISA recommends remediating Act vulnerabilities as soon as possible.

attend The vulnerability requires attention from the organization's internal, supervisory-level individuals. Necessary actions include requesting assistance or information about the vulnerability, and may involve publishing a notification either internally and/or externally. CISA recommends remediating Attend vulnerabilities sooner than standard update timelines.

track The vulnerability does not require action at this time. The organization would continue to track the vulnerability and reassess it if new information becomes available. CISA recommends remediating Track vulnerabilities within standard update timelines.

trackStar ("Track*" in the SSVC spec) The vulnerability contains specific characteristics that may require closer monitoring for changes. CISA recommends remediating Track* vulnerabilities within standard update timelines.

8.3.4 VexJustificationType

Summary

Specifies the VEX justification type.

Description

VexJustificationType specifies the type of Vulnerability Exploitability eXchange (VEX) justification.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Security/VexJustificationType>

Name: VexJustificationType

Entries

componentNotPresent The software is not affected because the vulnerable component is not in the product.

inlineMitigationsAlreadyExist Built-in inline controls or mitigations prevent an adversary from leveraging the vulnerability.

⁸⁶<https://www.cisa.gov/stakeholder-specific-vulnerability-categorization-ssvc>

vulnerableCodeCannotBeControlledByAdversary The vulnerable component is present, and the component contains the vulnerable code. However, vulnerable code is used in such a way that an attacker cannot mount any anticipated attack.

vulnerableCodeNotInExecutePath The affected code is not reachable through the execution of the code, including non-anticipated states of the product.

vulnerableCodeNotPresent The product is not affected because the code underlying the vulnerability is not present in the product.

9 Licensing

Summary

The Licensing Profile defines a minimum set of license information to facilitate compliance with typical license use cases.

Description

The Licensing profile only contains the additional requirement that any Software Artifact must have a Relationship of type `hasConcludedLicense`.

Classes and Property restrictions are defined in the SimpleLicensing Profile (Classes and Properties associated with license expression strings⁸⁷) and in the ExpandedLicensing Profile (Classes and Properties used for a fully parsed syntax tree of license expressions).

There are 2 relationship types related to licensing - `hasDeclaredLicense` and `hasConcludedLicense`.

If the `hasConcludedLicense` for a Software Artifact is not the same as its `hasDeclaredLicense`, a written explanation SHOULD be provided in the `hasConcludedLicense` relationship `comment` field.

A written explanation of a relationship to a `NoAssertionLicense` MAY be provided in the `comment` field for the relationship.

hasDeclaredLicense

A `hasDeclaredLicense` identifies the license information actually found in the Software Artifact, for example as detected by use of automated tooling.

This field is not intended to capture license information obtained from an external source, such as a package's website. Such information can be included, as needed, in the `hasConcludedLicense` field.

A `hasDeclaredLicense` may be expressed differently in practice for different types of Software Artifacts. For example:

- for Packages, it would include license info for the Package as a whole, found in the Package itself (e.g., LICENSE file, README file, metadata in the Package, etc.), but it would not include any license information that is not in the Package itself (e.g., license information from the project's website or from a third party repository or website).
- for Files, it would include license info found in the File itself (e.g., license header or notice, comments indicating the license, SPDX-License-Identifier expression), but it would not include license info found in a different file (e.g., LICENSE file in the top directory of a repository).
- for Snippets, it would include license info found in the Snippet itself (e.g., license notice, comments, SPDX-License-Identifier expression), but it would not include license info found elsewhere in the File or in a different File (e.g., comment at top of File if it is not within the Snippet, LICENSE file in the top directory of a repository).

A `hasDeclaredLicense` relationship to `NoneLicense` indicates that the corresponding Package, File or Snippet contains no license information whatsoever.

A `hasDeclaredLicense` relationship to `NoAssertionLicense` indicates that one of the following applies:

⁸⁷.././annexes/spdx-license-expressions.md

- the SPDX data creator has attempted to but cannot reach a reasonable objective determination;
- the SPDX data creator has made no attempt to determine this field; or
- the SPDX data creator has intentionally provided no information (no meaning should be implied by doing so).

If a `hasDeclaredLicense` relationship is not present, no assumptions can be made about whether or not a `hasDeclaredLicense` exists.

Note that a missing `hasDeclaredLicense` is not the same as a relationship to `NoAssertionLicense` since the latter is a “known unknown” whereas no assumptions can be made from a missing `hasDeclaredLicense` relationship.

hasConcludedLicense

A `hasConcludedLicense` is the license identified by the SPDX data creator, based on analyzing the license information in the Software Artifact and other information to arrive at a reasonably objective conclusion as to what license governs the Software Artifact.

A `hasConcludedLicense` relationship to `NoneLicense` indicates that the SPDX data creator has looked and did not find any license information for this Software Artifact.

A `hasConcludedLicense` relationship to `NoAssertionLicense` indicates that one of the following applies:

- the SPDX data creator has attempted to but cannot reach a reasonable objective determination;
- the SPDX data creator has made no attempt to determine this field; or
- the SPDX data creator has intentionally provided no information (no meaning should be implied by doing so).

If a `hasConcludedLicense` is not present, no assumptions can be made about whether or not a `hasConcludedLicense` exists.

Note that a missing `hasConcludedLicense` is not the same as a relationship to a `NoAssertionLicense` since the latter is a “known unknown” whereas no assumptions can be made from a missing `hasConcludedLicense` relationship.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Licensing>

<i>Name:</i> Licensing

Profile conformance

For an element collection to be conformant with this profile, the following has to hold:

1. for every `/Software/SoftwareArtifact` there MUST exist exactly one `/Core/Relationship` of type `hasConcludedLicense` having that element as its from property and a `/SimpleLicensing/AnyLicenseInfo` as its to property.

10 SimpleLicensing

Summary

Additional metadata relating to software licensing.

Description

The `SimpleLicensing` profile provides classes and properties to express licenses as a license expression⁸⁸ string.

It also provides the base abstract class, `AnyLicenseInfo`, used for references to license information.

⁸⁸../annexes/spdx-license-expressions.md

The SimpleLicensingText class provides a place to record any license text found that does not match a license on the SPDX License List⁸⁹.

The ExpandedLicensing profile can be used to represent the complete parsed license expressions.

Metadata

<https://spdx.org/rdf/3.0.1/terms/SimpleLicensing>

<i>Name:</i> SimpleLicensing

10.1 Classes

10.1.1 AnyLicenseInfo

Summary

Abstract class representing a license combination consisting of one or more licenses.

Description

AnyLicenseInfo is an abstract class representing a license combination consisting of one or more licenses (optionally including additional text), which may be combined according to the SPDX license expression syntax⁹⁰.

An AnyLicenseInfo is used by licensing properties of software artifacts.

It can be:

- a NoneLicense;
- a NoAssertionLicense;
- a single license (either on the SPDX License List⁹¹ or a custom-defined license⁹²);
- a single license with an “or later” operator applied;
- the foregoing with additional text applied; or
- a set of licenses combined by applying “AND” and “OR” operators recursively.

10.1.2 LicenseExpression

Summary

An SPDX Element containing an SPDX license expression string.

Description

A LicenseExpression enables the representation, in a single string, of a combination of one or more licenses, together with additions such as license exceptions.

The syntax for a licenseExpression string is set forth in the corresponding Annex of this specification (“SPDX license expressions”⁹³). A licenseExpression string is not valid if it does not conform to the grammar set forth in that Annex.

The ExpandedLicensing profile can be used to represent the complete parsed license expression as a combination of license objects.

10.2 Properties**10.2.1 customIdToUri****Summary**

Maps a LicenseRef or AdditionRef string for a Custom License or a Custom License Addition to its URI ID.

Description

Within a License Expression, references can be made to a Custom License or a Custom License Addition.

The License Expression syntax⁹⁵ dictates any reference starting with a “LicenseRef-” or “AdditionRef-” refers to license or addition text not found in the official SPDX License List⁹⁶.

These custom licenses must be a CustomLicense, a CustomLicenseAddition, or a SimpleLicensingText which are identified with a unique URI identifier.

The key for the DictionaryEntry is the string used in the license expression and the value is the URI for the corresponding CustomLicense, CustomLicenseAddition, or SimpleLicensingText.

10.2.2 licenseExpression**Summary**

A string in the license expression format.

Description

A licenseExpression enables the representation, in a single string, of a combination of one or more licenses, together with additions such as license exceptions.

⁹⁵../../annexes/spdx-license-expressions.md

⁹⁶<https://spdx.org/licenses/>

The syntax for a licenseExpression string is set forth in the corresponding Annex of this specification (“SPDX license expressions”⁹⁷). A licenseExpression string is not valid if it does not conform to the grammar set forth in that Annex. The ExpandedLicensing profile can be used to represent the complete parsed license expression as a combination of license objects.

<i>Range:</i>	xsd:string

Referenced

- /SimpleLicensing/LicenseExpression

10.2.3 licenseListVersion

Summary

The version of the SPDX License List used in the license expression.

Description

Recognizing that licenses are added to the SPDX License List⁹⁸ with each subsequent version, the intent is to provide consumers with the version of the SPDX License List used.

This anticipates that in the future, license expression might have used a version of the SPDX License List that is older than the then current one.

The specified version of the SPDX License List must include all listed licenses and exceptions referenced in the expression.

<i>Name:</i>	ExpandedLicensing
--------------	-------------------

11.1 Classes

11.1.1 ConjunctiveLicenseSet

Summary

Portion of an AnyLicenseInfo representing a set of licensing information where all elements apply.

Description

A ConjunctiveLicenseSet indicates that *each* of its subsidiary AnyLicenseInfos apply. In other words, a ConjunctiveLicenseSet of two or more licenses represents a licensing situation where *all* of the specified licenses are to be complied with. It is represented in the SPDX License Expression Syntax by the AND operator.

It is syntactically correct to specify a ConjunctiveLicenseSet where the subsidiary AnyLicenseInfos may be “incompatible” according to a particular interpretation of the corresponding Licenses. The SPDX License Expression Syntax¹⁰¹ does not take into account interpretation of license texts, which is left to the consumer of SPDX data to determine for themselves.

11.1.3 CustomLicenseAddition**Summary**

A license addition that is not listed on the SPDX Exceptions List.

Description

A CustomLicenseAddition represents an addition to a License that is not listed on the SPDX License Exceptions¹⁰³, and is therefore defined by an SPDX data creator.

It is intended to represent additional language which is meant to be added to a License, but which is not itself a standalone License.

11.1.4 DisjunctiveLicenseSet

Summary

Portion of an AnyLicenseInfo representing a set of licensing information where only one of the elements applies.

Description

A DisjunctiveLicenseSet indicates that *only one* of its subsidiary AnyLicenseInfos is required to apply. In other words, a DisjunctiveLicenseSet of two or more licenses represents a licensing situation where *only one* of the specified licenses are to be complied with.

A consumer of SPDX data would typically understand this to permit the recipient of the licensed content to choose which of the corresponding license they would prefer to use. It is represented in the SPDX License Expression Syntax by the OR operator.

11.1.8 LicenseAddition**Summary**

Abstract class for additional text intended to be added to a License, but which is not itself a standalone License.

Description

A LicenseAddition represents text which is intended to be added to a License as additional text, but which is not itself intended to be a standalone License.

It may be an exception which is listed on the SPDX License Exceptions¹⁰⁵ (ListedLicenseException), or may be any other additional text (as an exception or otherwise) which is defined by an SPDX data creator (CustomLicenseAddition).

11.1.11 OrLaterOperator

Summary

Portion of an AnyLicenseInfo representing this version, or any later version, of the indicated License.

Description

An OrLaterOperator indicates that this portion of the AnyLicenseInfo represents either (1) the specified version of the corresponding License, or (2) any later version of that License. It is represented in the SPDX License Expression Syntax by the + operator.

It is context-dependent, and unspecified by SPDX, as to what constitutes a “later version” of any particular License. Some Licenses may not be versioned, or may not have clearly-defined ordering for versions. The consumer of SPDX data will need to determine for themselves what meaning to attribute to a “later version” operator for a particular License.

11.1.12 WithAdditionOperator

Summary

Portion of an AnyLicenseInfo representing a License which has additional text applied to it.

Description

A WithAdditionOperator indicates that the designated License is subject to the designated LicenseAddition, which might be a license exception on the SPDX License Exceptions¹⁰⁸ (ListedLicenseException) or may be other additional text (CustomLicenseAddition). It is represented in the SPDX License Expression Syntax by the WITH operator.

11.2 Properties

11.2.1 additionText

Summary

Identifies the full text of a LicenseAddition.

Description

An additionText contains the plain text of the LicenseAddition, without templating or other similar markup.

Users of the additionText for a License can apply the [SPDX License List Matching Guidelines¹⁰⁹](#) when comparing it to another text for matching purposes.

Metadata

<https://spdx.org/rdf/3.0.1/terms/ExpandedLicensing/additionText>

<i>Name:</i>	additionText
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

<i>Name:</i>	deprecatedVersion
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /ExpandedLicensing/ListedLicense
- /ExpandedLicensing/ListedLicenseException

11.2.3 isDeprecatedAdditionId**Summary**

Specifies whether an additional text identifier has been marked as deprecated.

Description

The `isDeprecatedAdditionId` property specifies whether an identifier for a `LicenseAddition` has been marked as deprecated. If the property is not defined, then it is presumed to be false (i.e., not deprecated).

If the `LicenseAddition` is included on the SPDX License Exceptions¹¹², then the `deprecatedVersion` property indicates on which version release of the Exceptions List it was first marked as deprecated.

“Deprecated” in this context refers to deprecating the use of the *identifier*, not the underlying license addition. In other words, even if a `LicenseAddition`’s author or steward has stated that a particular `LicenseAddition` generally should not be used, that would *not* mean that the `LicenseAddition`’s identifier is “deprecated.” Rather, a `LicenseAddition` operator is typically marked as “deprecated” when it is determined that use of another identifier is preferable.

Metadata

<https://spdx.org/rdf/3.0.1/terms/ExpandedLicensing/isDeprecatedAdditionId>

<i>Name:</i>	isDeprecatedAdditionId
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:boolean

Referenced

- /ExpandedLicensing/LicenseAddition

11.2.4 isDeprecatedLicenseId**Summary**

Specifies whether a license or additional text identifier has been marked as deprecated.

Description

The `isDeprecatedLicenseId` property specifies whether an identifier for a `License` or `LicenseAddition` has been marked as deprecated. If the property is not defined, then it is presumed to be false (i.e., not deprecated).

If the `License` or `LicenseAddition` is included on the SPDX License List¹¹³, then the `deprecatedVersion` property indicates on which version release of the License List it was first marked as deprecated.

¹¹²<https://spdx.org/licenses/exceptions-index.html>

¹¹³<https://spdx.org/licenses/>

“Deprecated” in this context refers to deprecating the use of the *identifier*, not the underlying license. In other words, even if a License’s author or steward has stated that a particular License generally should not be used, that would *not* mean that the License’s identifier is “deprecated.” Rather, a License or LicenseAddition operator is typically marked as “deprecated” when it is determined that use of another identifier is preferable.

Metadata

11.2.5 isFsfLibre

Summary

Specifies whether the License is listed as free by the Free Software Foundation (FSF).

Description

isFsfLibre specifies whether the Free Software Foundation (FSF)¹¹⁴ has listed this License as “free” in their commentary on licenses, located at the time of this writing at Various Licenses and Comments about Them¹¹⁵.

A value of “true” indicates that the license is in the list of licenses that FSF publishes as libre.

A value of “false” indicates that the license is explicitly not in the corresponding list of FSF libre licenses (e.g., FSF has the license on a non-free list).

If the isFsfLibre field is not specified, the SPDX data creator makes no assertions about whether the License is listed in the FSF’s commentary.

11.2.6 isOsiApproved

Summary

Specifies whether the License is listed as approved by the Open Source Initiative (OSI).

¹¹⁴<https://fsf.org>

¹¹⁵<https://www.gnu.org/licenses/license-list.en.html>

Description

isOsiApproved specifies whether the Open Source Initiative (OSI)¹¹⁶ has listed this License as “approved” in their list of OSI Approved Licenses, located at the time of this writing at OSI Approved Licenses¹¹⁷.

A value of “true” indicates that the license is in the list of licenses that OSI publishes as approved.

A value of “false” indicates that the license is explicitly not in the corresponding list of OSI licenses (e.g., OSI has stated publicly that a license is not approved).

If the isOsiApproved field is not specified, the SPDX data creator makes no assertions about whether the License is approved by the OSI.

11.2.7 licenseXml**Summary**

Identifies all the text and metadata associated with a license in the license XML format.

Description

The license XML format is defined and used by the SPDX legal team.

The formal schema definition is available at SPDX License List XML Schema¹¹⁸.

For a text description of the XML fields, see XML template fields¹¹⁹.

Metadata

<https://spdx.org/rdf/3.0.1/terms/ExpandedLicensing/licenseXml>

<i>Name:</i>	licenseXml
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /ExpandedLicensing/License

- /ExpandedLicensing/DisjunctiveLicenseSet

11.2.10 obsoletedBy**Summary**

Specifies the licenseId that is preferred to be used in place of a deprecated License or LicenseAddition.

Description

An obsoletedBy value for a deprecated License or LicenseAddition specifies the licenseId of the replacement License or LicenseAddition that is preferred to be used in its place. It should use the same format as specified for a licenseId.

The License's or LicenseAddition's comment value may include more information about the reason why the licenseId specified in the obsoletedBy value is preferred.

11.2.11 seeAlso**Summary**

Contains a URL where the License or LicenseAddition can be found in use.

Description

A seeAlso defines a cross-reference with a URL where the License or LicenseAddition can be found in use by one or a few projects.

If applicable, it should include a URL where the license text is posted by the license steward, particularly if the license steward has made available a “canonical” primary URL for the license text.

If the license is OSI approved, a seeAlso should be included with the URL for the license’s listing on the OSI website.

The seeAlso URL may refer to a previously-available URL for the License or LicenseAddition which is no longer active.

Where applicable, the seeAlso URL should include the license text in its native language. seeAlso URLs to English or other translations may be included where multiple, equivalent official translations exist.

Metadata

<https://spdx.org/rdf/3.0.1/terms/ExpandedLicensing/seeAlso>

11.2.12 standardAdditionTemplate**Summary**

Identifies the full text of a LicenseAddition, in SPDX templating format.

Description

A standardAdditionTemplate contains a license addition template which describes sections of the LicenseAddition text which can be varied.

See the Legacy Text Template format section of the [SPDX License List Matching Guidelines](#)¹²¹ for format information.

It is recommended to use licenseXml¹²² instead, as it can capture all the text and metadata associated with a license.

11.3 Individuals**11.3.1 NoAssertionLicense****Summary**

An Individual Value for License when no assertion can be made about its actual value.

Description

NoAssertionLicense should be used if

- the SPDX creator has attempted to but cannot reach a reasonable objective determination;
- the SPDX creator has made no attempt to determine this field; or
- the SPDX creator has intentionally provided no information (no meaning should be implied by doing so).

Metadata

<https://spdx.org/rdf/3.0.1/terms/ExpandedLicensing/NoAssertionLicense>

<i>Name:</i>	NoAssertionLicense
<i>Type:</i>	IndividualLicensingInfo
<i>IRI:</i>	https://spdx.org/rdf/3.0.1/terms/Licensing/NoAssertion

11.3.2 NoneLicense**Summary**

An Individual Value for License where the SPDX data creator determines that no license is present.

Description

NoneLicense should be used if the SPDX creator determines there is no license available for this Artifact.

Metadata

<https://spdx.org/rdf/3.0.1/terms/ExpandedLicensing/NoneLicense>

<i>Name:</i>	NoneLicense
<i>Type:</i>	IndividualLicensingInfo
<i>IRI:</i>	https://spdx.org/rdf/3.0.1/terms/Licensing/None

12 Dataset**Summary**

The Dataset Profile provides additional metadata, based on Software Profile, that is useful for datasets.

Description

The Dataset namespace defines concepts related to dataset, including its preparation process, its characteristics, and its access methods.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset>

<i>Name:</i> Dataset

Profile conformance

For an element collection to be conformant with this profile, the following has to hold:

1. for every `/Dataset/DatasetPackage` there **MUST** exist exactly one `/Core/Relationship` of type `hasConcludedLicense` having that element as its from property and a `/SimpleLicensing/AnyLicenseInfo` as its to property.
2. for every `/Dataset/DatasetPackage` there **MUST** exist exactly one `/Core/Relationship` of type `hasDeclaredLicense` having that element as its from property and a `/SimpleLicensing/AnyLicenseInfo` as its to property.

12.1 Classes

12.1.1 DatasetPackage

Summary

Specifies a data package and its associated information.

Description

Metadata information that can be added to a dataset that may be used in a software or to train/test an AI package.

12.2 Properties**12.2.1 anonymizationMethodUsed****Summary**

Describes the anonymization methods used.

Description

A free-form text that describes the methods used to anonymize the dataset or fields in the dataset.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/anonymizationMethodUsed>

<i>Name:</i>	anonymizationMethodUsed
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Dataset/DatasetPackage

12.2.2 confidentialityLevel**Summary**

Describes the confidentiality level of the data points contained in the dataset.

Description

Describes the levels of confidentiality of the data points contained in the dataset.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/confidentialityLevel>

<i>Name:</i>	confidentialityLevel
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	ConfidentialityLevelType

Referenced

- /Dataset/DatasetPackage

12.2.3 dataCollectionProcess**Summary**

Describes how the dataset was collected.

Description

A free-form text that describes how a dataset was collected.

Examples include the sources from which a dataset was scrapped and the interview protocol that was used for data collection.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/dataCollectionProcess>

<i>Name:</i>	dataCollectionProcess
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

12.2.4 dataPreprocessing

Summary

Describes the preprocessing steps that were applied to the raw data to create the given dataset.

Description

A free-form text that describes the various preprocessing steps that were applied to the raw data to create the dataset.

Examples include standardization, normalization, deduplication, tokenization, and removal of tokens.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/dataPreprocessing>

<i>Name:</i>	dataPreprocessing
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Dataset/DatasetPackage

12.2.5 datasetAvailability

Summary

The field describes the availability of a dataset.

Description

Some datasets are publicly available and can be downloaded directly. Others are only accessible behind a clickthrough, or after filling a registration form. This field will describe the dataset availability from that perspective.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/datasetAvailability>

<i>Name:</i>	datasetAvailability
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	DatasetAvailabilityType

Referenced

- /Dataset/DatasetPackage

12.2.6 datasetNoise

Summary

Describes potentially noisy elements of the dataset.

Description

Describes what kinds of noises a dataset might encompass.

The free-form text specifies fields or samples that might be noisy.

Alternatively, it can also be used to describe various noises that could impact the whole dataset.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/datasetNoise>

<i>Name:</i>	datasetNoise
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Dataset/DatasetPackage

12.2.7 datasetSize**Summary**

Captures the size of the dataset.

Description

Captures how large a dataset is.

The size is to be measured in bytes.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/datasetSize>

<i>Name:</i>	datasetSize
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:nonNegativeInteger

Referenced

- /Dataset/DatasetPackage

12.2.8 datasetType**Summary**

Describes the type of the given dataset.

Description

Describes the datatype contained in the dataset.

For example, a dataset can be an image dataset for computer vision applications, a text dataset such as the contents of a book or Wikipedia article, or sometimes a multimodal dataset that contains multiple types of data.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/datasetType>

<i>Name:</i>	datasetType
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	DatasetType

Referenced

- /Dataset/DatasetPackage

12.2.9 datasetUpdateMechanism

Summary

Describes a mechanism to update the dataset.

Description

A free-form text that describes a mechanism to update the dataset.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/datasetUpdateMechanism>

<i>Name:</i>	datasetUpdateMechanism
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Dataset/DatasetPackage

12.2.10 hasSensitivePersonalInformation

Summary

Describes if any sensitive personal information is present in the dataset.

Description

Indicates the presence of sensitive personal data or information that allows drawing conclusions about a person's identity.

Related: useSensitivePersonalInformation in /AI/AIPackage

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/hasSensitivePersonalInformation>

<i>Name:</i>	hasSensitivePersonalInformation
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	/Core/PresenceType

Referenced

- /Dataset/DatasetPackage

12.2.11 intendedUse

Summary

Describes what the given dataset should be used for.

Description

A free-form text that describes what the given dataset should be used for.

Some datasets are collected to be used only for particular purposes.

For example, medical data collected from a specific demography might only be applicable for training machine learning models to make predictions for that demography. In such a case, the intendedUse field would capture this information. Similarly, if a dataset is collected for building a facial recognition model, the intendedUse field would specify that.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/intendedUse>

<i>Name:</i>	intendedUse
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Dataset/DatasetPackage

12.2.12 knownBias**Summary**

Records the biases that the dataset is known to encompass.

Description

A free-form text that describes the different biases that the dataset encompasses.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/knownBias>

<i>Name:</i>	knownBias
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Dataset/DatasetPackage

12.2.13 sensor**Summary**

Describes a sensor used for collecting the data.

Description

Describes a sensor that was used for collecting the data and its calibration value as a key-value pair.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/sensor>

<i>Name:</i>	sensor
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	/Core/DictionaryEntry

Referenced

- /Dataset/DatasetPackage

12.3 Vocabularies

12.3.1 ConfidentialityLevelType

Summary

Categories of confidentiality level.

Description

Describes the different confidentiality levels as given by the Traffic Light Protocol¹²⁵.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/ConfidentialityLevelType>

<i>Name:</i> ConfidentialityLevelType

Entries

amber Data points in the dataset can be shared only with specific organizations and their clients on a need to know basis.

clear Dataset may be distributed freely, without restriction.

green Dataset can be shared within a community of peers and partners.

red Data points in the dataset are highly confidential and can only be shared with named recipients.

12.3.2 DatasetAvailabilityType

Summary

Availability of dataset.

Description

Describes the possible types of availability of a dataset, indicating whether the dataset can be directly downloaded, can be assembled using a script for scraping the data, is only available after a clickthrough or a registration form.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/DatasetAvailabilityType>

<i>Name:</i> DatasetAvailabilityType

Entries

clickthrough the dataset is not publicly available and can only be accessed after affirmatively accepting terms on a clickthrough webpage.

directDownload the dataset is publicly available and can be downloaded directly.

query the dataset is publicly available, but not all at once, and can only be accessed through queries which return parts of the dataset.

registration the dataset is not publicly available and an email registration is required before accessing the dataset, although without an affirmative acceptance of terms.

scrapingScript the dataset provider is not making available the underlying data and the dataset must be reassembled, typically using the provided script for scraping the data.

¹²⁵https://en.wikipedia.org/wiki/Traffic_Light_Protocol

12.3.3 DatasetType

Summary

Enumeration of dataset types.

Description

Describes the different structures of data within a given dataset. A dataset can have multiple types of data, or even a single type of data but still match multiple types, for example sensor data could also be timeseries or labeled image data could also be considered categorical.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Dataset/DatasetType>

<i>Name:</i> DatasetType

Entries

audio data is audio based, such as a collection of music from the 80s.

categorical data that is classified into a discrete number of categories, such as the eye color of a population of people.

graph data is in the form of a graph where entries are somehow related to each other through edges, such a social network of friends.

image data is a collection of images such as pictures of animals.

noAssertion data type is not known.

numeric data consists only of numeric entries.

other data is of a type not included in this list.

sensor data is recorded from a physical sensor, such as a thermometer reading or biometric device.

structured data is stored in tabular format or retrieved from a relational database.

syntactic data describes the syntax or semantics of a language or text, such as a parse tree used for natural language processing.

text data consists of unstructured text, such as a book, Wikipedia article (without images), or transcript.

timeseries data is recorded in an ordered sequence of timestamped entries, such as the price of a stock over the course of a day.

timestamp data is recorded with a timestamp for each entry, but not necessarily ordered or at specific intervals, such as when a taxi ride starts and ends.

video data is video based, such as a collection of movie clips featuring Tom Hanks.

13 AI

Summary

The AI Profile is designed to provide a standardized way of documenting and sharing information about AI software packages (i.e. systems).

Description

The AI namespace defines a set of concepts and data elements related to AI system and model artifacts. These artifacts are the tangible outputs of the AI development process, such as software packages, models, and datasets.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI>

<i>Name:</i> AI

Profile conformance

For an element collection to be conformant with this profile, the following has to hold:

1. for every /AI/AIPackage there MUST exist exactly one /Core/Relationship of type hasConcludedLicense having that element as its from property and a /SimpleLicensing/AnyLicenseInfo as its to property.
2. for every /AI/AIPackage there MUST exist exactly one /Core/Relationship of type hasDeclaredLicense having that element as its from property and a /SimpleLicensing/AnyLicenseInfo as its to property.

13.1 Classes

13.1.1 AIPackage

Summary

Specifies an AI package and its associated information.

Description

Metadata information that can be added to a package to describe an AI application or trained AI model.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/AIPackage>

<i>Name:</i>	AIPackage

13.1.2 EnergyConsumption**Summary**

A class for describing the energy consumption incurred by an AI model in different stages of its lifecycle.

Description

A class to denote the known or estimated energy consumption of an AI model during its training, fine-tuning, and inference stages.

Example

```
{
  "type": "ai_EnergyConsumption",
  "ai_trainingEnergyConsumption": [
    {
      "type": "ai_EnergyConsumptionDescription",
      "ai_energyQuantity": "36.5",
      "ai_energyUnit": "kilowattHour"
    }
  ],
  "ai_inferenceEnergyConsumption": [
    {
      "type": "ai_EnergyConsumptionDescription",
      "ai_energyQuantity": "0.042",
      "ai_energyUnit": "kilowattHour"
    }
  ]
}
```

13.1.3 EnergyConsumptionDescription

Summary

The class that helps note down the quantity of energy consumption and the unit used for measurement.

Description

This class is designed to store energy consumption data, including the quantity and the unit of measurement.

The energyQuantity property stores the amount of energy consumed, and the energyUnit property stores the unit used for measurement.

For example, 0.0042 kilowatt-hour of energy will have 0.042 as a value for property energyQuantity, and "kilowattHour" as a value for property energyUnit.

Example

```
{
  "type": "ai_EnergyConsumptionDescription",
```

```
"ai_energyQuantity": "0.042",
"ai_energyUnit": "kilowattHour"
}
```

13.2 Properties

13.2.1 autonomyType

Summary

Indicates whether the system can perform a decision or action without human involvement or guidance.

Description

Indicates if the system is fully automated or a human is involved in any of the decisions of the AI system.

- yes: Indicates that the system is fully automated.
- no: Indicates that a human is involved in any of the decisions of the AI system.
- noAssertion: Makes no assertion about the autonomy.

13.2.2 domain

Summary

Captures the domain in which the AI package can be used.

Description

A free-form text that describes the domain where the AI model contained in the AI software can be expected to operate successfully.

Examples include computer vision, natural language processing, etc.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/domain>

<i>Name:</i>	domain
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /AI/AIPackage

13.2.3 energyConsumption**Summary**

Indicates the amount of energy consumption incurred by an AI model.

Description

Captures the energy consumption of an AI model, either known or estimated.

In the absence of direct measurements, an SPDX data creator may choose to estimate the energy consumption based on information about computational resources (e.g., number of floating-point operations), training time, and other relevant training details.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/energyConsumption>

<i>Name:</i>	energyConsumption
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	EnergyConsumption

Referenced

- /AI/AIPackage

13.2.4 energyQuantity**Summary**

Represents the energy quantity.

Description

Provides the quantity information of the energy.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/energyQuantity>

<i>Name:</i>	energyQuantity
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:decimal

Referenced

- /AI/EnergyConsumptionDescription

13.2.5 energyUnit**Summary**

Specifies the unit in which energy is measured.

Description

Provides the unit information of the energy.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/energyUnit>

<i>Name:</i>	energyUnit
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	EnergyUnitType

Referenced

- /AI/EnergyConsumptionDescription

13.2.6 finetuningEnergyConsumption**Summary**

Specifies the amount of energy consumed when finetuning the AI model that is being used in the AI system.

Description

The field specifies the amount of energy consumed when finetuning the AI model that is being used in the AI system.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/finetuningEnergyConsumption>

<i>Name:</i>	finetuningEnergyConsumption
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	EnergyConsumptionDescription

Referenced

- /AI/EnergyConsumption

13.2.7 hyperparameter**Summary**

Records a hyperparameter used to build the AI model contained in the AI package.

Description

Records a hyperparameter value.

Hyperparameters are settings defined before the training process that control the learning algorithm's behavior. They differ from model parameters, which are learned from the data during training. Developers typically set hyperparameters manually or through a process of hyperparameter tuning (also known as trial and error).

Examples of hyperparameters include learning rate, batch size, and the number of layers in a neural network.

13.2.9 informationAboutApplication

Summary

Provides relevant information about the AI software, not including the model description.

Description

A free-form text description of how the AI model is used within the software.

It should include any relevant information, such as pre-processing steps, third-party APIs, and other pertinent details.

It can also include:

- Functionality provided by the AI model within the software application, including: any specific tasks or decisions it is designed to perform; any pre-processing steps that are applied to the input data before it is fed into the AI model for inference, such as data cleaning, normalization, or feature extraction; and any third-party APIs or services that are used in conjunction with the AI model, such as data sources, cloud services, or other AI models.
- Description of any dependencies or requirements needed to run the AI model within the software application, including: specific hardware, software libraries, and operating systems.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/informationAboutApplication>

<i>Name:</i>	informationAboutApplication
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

13.2.10 informationAboutTraining**Summary**

Describes relevant information about different steps of the training process.

Description

A detailed explanation of the training process, including the specific techniques, algorithms, and methods employed.

Examples include:

- training data used to train the AI model, along with any relevant details about its source, quality, and pre-processing steps;
- specific training algorithms employed, including stochastic gradient descent, backpropagation, and reinforcement learning;
- specific training techniques used to improve the performance or accuracy of the AI model, such as transfer learning, fine-tuning, or active learning; and
- any evaluation metrics used to assess the performance of the AI model during the training process, including accuracy, precision, recall, and F1 score.

<i>Name:</i>	informationAboutTraining
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /AI/AIPackage

13.2.11 limitation**Summary**

Captures a limitation of the AI software.

Description

A free-form text that captures a limitation of the AI package (or of the AI models present in the AI package).

Note that this is not guaranteed to be exhaustive.

For instance, a limitation might be that the AI package cannot be used on datasets from a certain demography.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/limitation>

<i>Name:</i>	limitation
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /AI/AIPackage

13.2.12 metric**Summary**

Records the measurement of prediction quality of the AI model.

Description

Records the measurement with which the AI model was evaluated.

This makes statements about the prediction quality including uncertainty, accuracy, characteristics of the tested population, quality, fairness, explainability, robustness etc.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/metric>

<i>Name:</i>	metric
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	/Core/DictionaryEntry

Referenced

- /AI/AIPackage

13.2.13 metricDecisionThreshold**Summary**

Captures the threshold that was used for computation of a metric described in the metric field.

Description

Each metric might be computed based on a decision threshold.

For instance, precision or recall is typically computed by checking if the probability of the outcome is larger than 0.5.

Each decision threshold should match with a metric field defined in the AI package.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/metricDecisionThreshold>

<i>Name:</i>	metricDecisionThreshold
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	/Core/DictionaryEntry

13.2.14 modelDataPreprocessing

Summary

Describes all the preprocessing steps applied to the training data before the model training.

Description

A free-form text that describes the preprocessing steps applied to the training data before training of the model(s) contained in the AI software.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/modelDataPreprocessing>

<i>Name:</i>	modelDataPreprocessing
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /AI/AIPackage

13.2.15 modelExplainability

Summary

Describes methods that can be used to explain the results from the AI model.

Description

A free-form text that lists the different explainability mechanisms and how they can be used to explain the results from the AI model.

The mechanisms can be model-agnostic methods, such as SHapley Additive exPlanations (SHAP)¹²⁶ and Local Interpretable Model-agnostic Explanations (LIME)¹²⁷, and model-specific methods that applied to a limited category of models.

13.2.16 safetyRiskAssessment

Summary

Records the results of general safety risk assessment of the AI system.

¹²⁶<https://shap.readthedocs.io/>

¹²⁷<https://github.com/marcotcr/lime>

Description

Records the results of general safety risk assessment of the AI system.

Using categorization according to the EU general risk assessment methodology¹²⁸. The methodology implements Article 20 of Regulation (EC) No 765/2008 and is intended to assist authorities when they assess general product safety compliance.

It is important to note that this categorization differs from the one proposed in the EU AI Act's provisional agreement.

Metadata

<i>Name:</i>	safetyRiskAssessment
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	SafetyRiskAssessmentType

Referenced

- /AI/AIPackage

13.2.17 standardCompliance**Summary**

Captures a standard that is being complied with.

Description

A free-form text that captures a standard that the AI software complies with.

This includes both published and unpublished standards, such as those developed by ISO, IEEE, and ETSI.

The standard may, but is not necessarily required to, satisfy a legal or regulatory requirement.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/standardCompliance>

<i>Name:</i>	standardCompliance
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

13.3 Vocabularies

13.3.1 EnergyUnitType

Summary

Specifies the unit of energy consumption.

Description

List the different acceptable units for measuring energy consumption.

If the unit in which the energy consumption has been recorded is not listed here, please select “other”.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/EnergyUnitType>

<i>Name:</i> EnergyUnitType

Entries

kilowattHour Kilowatt-hour.

megajoule Megajoule.

other Any other units of energy measurement.

13.3.2 SafetyRiskAssessmentType

Summary

Specifies the safety risk level.

Description

Lists the different general safety risk levels that can be used to describe the general safety risk of an AI system.

Using categorization according to the EU general risk assessment methodology¹²⁹. The methodology implements Article 20 of Regulation (EC) No 765/2008 and is intended to assist authorities when they assess general product safety compliance.

Metadata

<https://spdx.org/rdf/3.0.1/terms/AI/SafetyRiskAssessmentType>

<i>Name:</i> SafetyRiskAssessmentType

Entries

high The second-highest level of risk posed by an AI system.

low Low/no risk is posed by an AI system.

medium The third-highest level of risk posed by an AI system.

serious The highest level of risk posed by an AI system.

¹²⁹<https://ec.europa.eu/docsroom/documents/17107>

14 Build

Summary

The Build Profile defines the set of information required to describe an instance of a Software Build.

Description

A Software Build is defined here as the act of converting software inputs into software artifacts using software build tools. Inputs can include source code, config files, artifacts that are build environments, and build tools. Outputs can include intermediate artifacts to other build inputs or the final artifacts.

The Build profile provides a subclass of Element called Build.

It also provides a minimum set of required Relationship Types from the Core profile:

- `hasInput`: Describes the relationship from the Build element to its inputs.
- `hasOutput`: Describes the relationship from the Build element to its outputs.
- `invokedBy`: Describes the relationship from the Build element to the Agent that invoked it.

In addition, the following Relationship Types may be used to describe a Build.

- `hasHost`: Describes the relationship from the Build element to the build stage or host.
- `configures`: Describes the relationship from a configuration to the Build element.
- `ancestorOf`: Describes a relationship from a Build element to Build elements that describe its child builds.
- `descendantOf`: Describes a relationship from a child Build element to its parent.
- `usesTool`: Describes a relationship from a Build element to a build tool.

All relationships in the Build Profile are scoped to the “build” LifecycleScopeType period.

The `hasInput` relationship can be applied to a config file or a build tool if the nature of these inputs are not known at the creation of an SPDX document.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Build>

<i>Name:</i> Build

14.1 Classes

14.1.1 Build

Summary

Class that describes a build instance of software/artifacts.

Description

A build is a representation of the process in which a piece of software or artifact is built. It encapsulates information related to a build process and provides an element from which relationships can be created to describe the build’s inputs, outputs, and related entities (e.g. builders, identities, etc.).

ExternalIdentifier of type “urlScheme” may be used to identify build logs. In this case, the comment of the ExternalIdentifier should be “LogReference”.

Note that `buildStartTime` and `buildEndTime` are optional, and may be omitted to simplify creating reproducible builds.

14.2.2 buildId**Summary**

A buildId is a locally unique identifier used by a builder to identify a unique instance of a build produced by it.

Description

A buildId is a locally unique identifier to identify a unique instance of a build, according to the buildType.

This identifier differs based on build toolchain, platform, or naming convention used by an organization or standard.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Build/buildId>

- /Build/Build

14.2.3 buildStartTime**Summary**

Property describing the start time of a build.

Description

buildStartTime is the time at which a build is triggered.

The builder typically records this value.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Build/buildStartTime>

<i>Name:</i>	buildStartTime
<i>Nature:</i>	DataProperty
<i>Range:</i>	/Core/DateTime

Referenced

- /Build/Build

14.2.4 buildType**Summary**

A buildType is a hint that is used to indicate the toolchain, platform, or infrastructure that the build was invoked on.

Description

A buildType is an IRI expressing the toolchain, platform, or infrastructure that the build was invoked on.

The buildType is used to interpret the meaning of other build parameters by defining the “type” of build; if the same buildType is seen in different Build elements, it means they are the same kind of build, but difference instances and possible with different configurations.

If you are not using a well-known buildType, it should be namespaced to a domain you own to prevent conflicts with other buildType IRIs.

Examples of a buildType might be:

- A GitHub action workflow
- A step in a GitHub actions pipeline
- An invocation of a compiler or other tool
- A script that orchestrates builds at a higher level

Keep in mind that builds can be “nested” using the ancestorOf relationship.

If the buildType IRI is not recognized, it is still possible to inspect other properties of the build, but it may not be possible to derive deeper meaning from them.

For more information, see the SLSA definition of buildType.

14.2.5 configSourceDigest**Summary**

Property that describes the digest of the build configuration file used to invoke a build.

Description

configSourceDigest is the checksum of the build configuration file used by a builder to execute a build, according to the buildType.

This Property uses the Core model’s Hash¹³⁰ class.

¹³⁰[0.././Core/Classes/Hash.md](#)

Metadata

<https://spdx.org/rdf/3.0.1/terms/Build/configSourceDigest>

<i>Name:</i>	configSourceDigest
<i>Nature:</i>	ObjectProperty
<i>Range:</i>	/Core/Hash

Referenced

- /Build/Build

14.2.6 configSourceEntrypoint**Summary**

Property describes the invocation entrypoint of a build.

Description

A build entrypoint is the invoked executable of a build which always runs when the build is triggered, according to the buildType.

For example, when a build is triggered by running a shell script, the entrypoint is `script.sh`.

In terms of a declared build, the entrypoint is the position in a configuration file or a build declaration which is always run when the build is triggered.

For example, in the following configuration file, the entrypoint of the build is `publish`.

```
name: Publish packages to PyPI

on:
  create:
    tags: "*"

jobs:
  publish:
    runs-on: ubuntu-latest
    if: startsWith(github.ref, 'refs/tags/')
    steps:
...

```

Metadata

<i>Name:</i>	configSourceEntrypoint
<i>Nature:</i>	DataProperty
<i>Range:</i>	xsd:string

Referenced

- /Build/Build

14.2.7 configSourceUri**Summary**

Property that describes the URI of the build configuration source file.

Description

If a build configuration exists for the toolchain or platform performing the build, the `configSourceUri` of a build is the URI of that build configuration, according to the `buildType`.

For example, a build triggered by a GitHub Action is defined by a build configuration YAML file. In this case, the `configSourceUri` is the URL of that YAML file.

14.2.8 environment**Summary**

Property describing the session in which a build is invoked.

Description

`environment` is a map of environment variables and values that are set during a build session, according to the `buildType`.

This is different from the parameter¹³¹ property in that it describes the environment variables set before a build is invoked rather than the variables provided to the builder.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Build/environment>

<i>Name:</i>	<code>environment</code>
<i>Nature:</i>	<code>ObjectProperty</code>
<i>Range:</i>	<code>/Core/DictionaryEntry</code>

- `/Build/Build`

14.2.9 parameter**Summary**

Property describing a parameter used in an instance of a build.

Description

`parameter` is a key-value of a build parameter and its value that was provided to the builder for a build instance, according to the `buildType`.

This is different from the `environment`¹³² property in that the key and value are provided as command line arguments or a configuration file to the builder.

15 Lite**Summary**

The SPDX Lite profile defines a simple view of SPDX data, from the point of view of use cases in some industries.

Description

The SPDX Lite profile consists of mandatory and recommended information.

The mandatory data in SPDX Lite is basic but useful for complying with licenses. It is easy to understand licensing information by reading an SPDX Lite file.

SPDX Lite aims at a balance between the full SPDX data model and actual workflows in some industries.

An SPDX Lite document can also be used in parallel with other SPDX documents in software supply chains.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Lite>

<i>Name:</i>	Lite
--------------	------

Profile conformance

In addition to the following mandatory requirements, please refer to the corresponding Annex for elements that should be included as part of a document conforming to the Lite profile.

For a /Software/Package to be conformant with this profile, the following has to hold:

1. The minCount for copyrightText is 1
2. The minCount for packageVersion is 1
3. The minCount for suppliedBy is 1
4. At least one of downloadLocation or packageUrl must be present

Additionally:

1. for every /Software/Package there MUST exist exactly one /Core/Relationship of type hasConcludedLicense having that element as its from property and a /SimpleLicensing/AnyLicenseInfo as its to property.
2. for every /Software/Package there MUST exist exactly one /Core/Relationship of type hasDeclaredLicense having that element as its from property and a /SimpleLicensing/AnyLicenseInfo as its to property.

For a /Core/SpdxDocument to be conformant with this profile, the following has to hold:

1. The minCount for element is 1
2. The minCount for rootElement is 1

For a `/Software/Sbom` to be conformant with this profile, the following has to hold:

1. The `minCount` for `element` is 1
2. The `minCount` for `rootElement` is 1

Finally, for a `/Core/Agent` to be conformant with this profile, the following has to hold:

1. The `minCount` for `name` is 1

16 Extension

Summary

Everything having to do with SPDX extensions.

Description

The Extension namespace defines the abstract Extension class serving as the base for all defined extension subclasses.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Extension>

<i>Name:</i>	Extension
--------------	-----------

16.1 Classes

16.1.1 CdxPropertiesExtension

Summary

A type of extension consisting of a list of name value pairs.

Description

This extension provides a more structured extension using a name-value approach.

Unlike key-value stores, properties in `CdxPropertiesExtension` support duplicate names, each potentially having different values.

This is intended to be compatible with the CycloneDX property properties.

Metadata

<https://spdx.org/rdf/3.0.1/terms/Extension/CdxPropertiesExtension>

cdxProperty	CdxPropertyEntry	1	*

16.1.2 CdxPropertyEntry**Summary**

A property name with an associated value.

Description

Each CdxPropertyEntry contains a name-value pair which maps the name to its associated value.

Unlike key-value stores, properties in CdxPropertiesExtension support duplicate names, each potentially having different values.

This class can be used to implement CycloneDX compatible properties.

16.1.3 Extension**Summary**

A characterization of some aspect of an Element that is associated with the Element in a generalized fashion.

Description

An Extension is a characterization of some aspect of an Element that is associated with the Element in a generalized fashion.

Rather than being associated with a particular Element through the typical use of a purpose-specific object property an Extension is associated with the Element it characterizes using a single common generalized object property.

This approach serves multiple purposes:

1. Support profile-based extended characterization of Elements. Enables specification and expression of Element characterization extensions within any profile and namespace of SPDX without requiring changes to other profiles or namespaces and without requiring local subclassing of remote classes (which could inhibit ecosystem interoperability in some cases).
2. Support extension of SPDX by adopting individuals or communities with Element characterization details uniquely specialized to their particular context. Enables adopting individuals or communities to utilize SPDX expressive capabilities along with expressing more arcane Element characterization details specific to them and not appropriate for standardization across SPDX.
3. Support structured capture of expressive solutions for gaps in SPDX coverage from real-world use. Enables adopting individuals or communities to express Element characterization details they require that are not currently defined in SPDX but likely should be. Enables a practical pipeline that:
 - identifies gaps in SPDX that should be filled,
 - expresses solutions to those gaps in a way that allows the identifying adopters to use the extended solutions with SPDX and does not conflict with current SPDX,
 - can be clearly detected among the SPDX content exchange ecosystem,
 - provides a clear and structured definition of gap solution that can be used as submission for revision to SPDX standard

16.2 Properties

16.2.1 cdxPropName

Summary

A name used in a CdxPropertyEntry name-value pair.

Description

A cdxPropName is used in a CdxPropertyEntry name-value pair.

Unlike key-value stores, properties in CdxPropertiesExtension support duplicate names, each potentially having different values.

Metadata

16.2.2 cdxPropValue

Summary

A value used in a CdxPropertyEntry name-value pair.

Description

A `cdxPropValue` is used in a `CdxPropertyEntry` name-value pair.

Unlike key-value stores, properties in `CdxPropertiesExtension` support duplicate names, each potentially having different values.

16.2.3 cdxProperty**Summary**

Provides a map of a property names to a values.

Description

This field provides a mapping of a name to a value.

This is intended to be compatible with the CycloneDX property properties.

Unlike key-value stores, properties in `CdxPropertiesExtension` support duplicate names, each potentially having different values.

Annex B

SPDX license expressions (Normative)

B.1 Overview

Often a single license can be used to represent the licensing terms of a source code or binary file, but there are situations where a single license identifier is not sufficient. A common example is when software is offered under a choice of one or more licenses (e.g., GPL-2.0-only OR BSD-3-Clause). Another example is when a set of licenses is needed to represent a binary program constructed by compiling and linking two (or more) different source files each governed by different licenses (e.g., LGPL-2.1-only AND BSD-3-Clause).

SPDX License Expressions provide a way for one to construct expressions that more accurately represent the licensing terms typically found in open source software source code. A license expression could be a single license identifier found on the SPDX License List; a user defined license reference denoted by the LicenseRef-[idString]; a license identifier combined with an SPDX exception; or some combination of license identifiers, license references and exceptions constructed using a small set of defined operators (e.g., AND, OR, WITH and +). We provide the definition of what constitutes a valid SPDX License Expression in this section.

The exact syntax of license expressions is described below in ABNF, as defined in RFC 5234¹ and expanded in RFC 7405².

```
idstring = 1*(ALPHA / DIGIT / "-" / "." )

license-id = <short form license identifier from SPDX License List>

license-exception-id = <short form license exception identifier from SPDX License List>

license-ref = [%s"DocumentRef-"(idstring)":" ]%s"LicenseRef-"(idstring)

addition-ref = [%s"DocumentRef-"(idstring)":" ]%s"AdditionRef-"(idstring)

simple-expression = license-id / license-id"+" / license-ref

addition-expression = license-exception-id / addition-ref

compound-expression = (simple-expression /

    simple-expression ( %s"WITH" / %s"with" ) addition-expression /

    compound-expression ( %s"AND" / %s"and" ) compound-expression /

    compound-expression ( %s"OR" / %s"or" ) compound-expression /

    "(" compound-expression ")" )

license-expression = (simple-expression / compound-expression)
```

In the following sections we describe in more detail <license-expression> construct, a licensing expression string that enables a more accurate representation of the licensing terms of modern-day software.

A valid <license-expression> string consists of either:

¹<https://datatracker.ietf.org/doc/rfc5234/>

²<https://datatracker.ietf.org/doc/rfc7405/>

- (i) a simple license expression, such as a single license identifier; or
- (ii) a more complex expression constructed by combining smaller valid expressions using Boolean license operators.

There **MUST NOT** be white space between a license-id and any following `+`. This supports easy parsing and backwards compatibility. There **MUST** be white space on either side of the operator `"WITH"`. There **MUST** be white space and/or parentheses on either side of the operators `AND` and `OR`.

In the `tag:value` format, a license expression **MUST** be on a single line, and **MUST NOT** include a line break in the middle of the expression.

B.2 Case sensitivity

License expression operators (`AND`, `and`, `OR`, `or`, `WITH` and `with`) should be matched in a *case-sensitive* manner, i.e., letters must be all upper case or all lower case.

License identifiers (including license exception identifiers) used in SPDX documents or source code files should be matched in a *case-insensitive* manner. In other words, `MIT`, `Mit` and `mIt` should all be treated as the same identifier and referring to the same license.

However, please be aware that it is often important to match with the case of the canonical identifier on the [SPDX License List](#)³. This is because the canonical identifier's case is used in the URL of the license's or exception's entry on the List, and because the canonical identifier is translated to a URI in RDF documents.

For user defined license identifiers, only the variable part (after `LicenseRef-`) is case insensitive. This means, for example, that `LicenseRef-Name` and `LicenseRef-name` should be treated as the same identifier and considered to refer to the same license, while `licenseref-name` is not a valid license identifier.

The same applies to `AdditionRef-` user defined identifiers.

B.3 Simple license expressions

A simple `<license-expression>` is composed one of the following:

- An SPDX License List Short Form Identifier. For example: `CDDL-1.0`
- An SPDX License List Short Form Identifier with a unary `"+"` operator suffix to represent the current version of the license or any later version. For example: `CDDL-1.0+`
- An SPDX user defined license reference: `[“DocumentRef-”1*(idstring)“:”]“LicenseRef-”1*(idstring)`

Some examples:

`LicenseRef-23`

`LicenseRef-MIT-Style-1`

`DocumentRef-spdx-tool-1.2:LicenseRef-MIT-Style-2`

The current set of valid license identifiers can be found in spdx.org/licenses⁴.

³<https://spdx.org/licenses>

⁴<https://spdx.org/licenses>

B.4 Composite license expressions

B.4.1 Introduction

More expressive composite license expressions can be constructed using “OR”, “AND”, and “WITH” operators similar to constructing mathematical expressions using arithmetic operators.

For the `tag:value` format, any license expression that consists of more than one license identifier and/or LicenseRef, may optionally be encapsulated by parentheses: “()”.

Nested parentheses can also be used to specify an order of precedence which is discussed in more detail in Order of precedence and parentheses.

B.4.2 Disjunctive “OR” operator

If presented with a choice between two or more licenses, use the disjunctive binary “OR” operator to construct a new license expression, where both the left and right operands are valid license expression values.

For example, when given a choice between the LGPL-2.1-only or MIT licenses, a valid expression would be:

```
LGPL-2.1-only OR MIT
```

The “OR” operator is commutative, meaning that the above expression should be considered equivalent to:

```
MIT OR LGPL-2.1-only
```

An example representing a choice between three different licenses would be:

```
LGPL-2.1-only OR MIT OR BSD-3-Clause
```

It is allowed to use the operator in lower case form `or`.

B.4.3 Conjunctive “AND” operator

If required to simultaneously comply with two or more licenses, use the conjunctive binary “AND” operator to construct a new license expression, where both the left and right operands are a valid license expression values.

For example, when one is required to comply with both the LGPL-2.1-only or MIT licenses, a valid expression would be:

```
LGPL-2.1-only AND MIT
```

The “AND” operator is commutative, meaning that the above expression should be considered equivalent to:

```
MIT AND LGPL-2.1-only
```

An example where all three different licenses apply would be:

```
LGPL-2.1-only AND MIT AND BSD-2-Clause
```

It is allowed to use the operator in lower case form `and`.

B.4.4 Additive “WITH” operator

Sometimes license texts are found with additional text, which might or might not modify the original license terms.

In this case, use the binary “WITH” operator to construct a new license expression to represent the special situation. A valid `<license-expression>` is where the left operand is a `<simple-expression>` value and the right operand is a `<addition-expression>` that represents the additional text.

The `<addition-expression>` can be either a `<license-exception-id>` from the SPDX License List, or a user defined addition reference in the form `[“DocumentRef-”(idstring):”]“AdditionRef-”(idstring)`

For example, when the Bison exception is to be applied to GPL-2.0-or-later, the expression would be:

```
GPL-2.0-or-later WITH Bison-exception-2.2
```

The current set of valid license exceptions identifiers can be found in spdx.org/licenses⁵.

It is allowed to use the operator in lower case form `with`.

B.4.5 Order of precedence and parentheses

The order of application of the operators in an expression matters (similar to mathematical operators). The default operator order of precedence of a `<license-expression>` is:

```
+
WITH
AND
OR
```

where a lower order operator is applied before a higher order operator.

For example, the following expression:

```
LGPL-2.1-only OR BSD-3-Clause AND MIT
```

represents a license choice between either LGPL-2.1-only and the expression BSD-3-Clause AND MIT because the AND operator takes precedence over (is applied before) the OR operator.

When required to express an order of precedence that is different from the default order a `<license-expression>` can be encapsulated in pairs of parentheses: (), to indicate that the operators found inside the parentheses takes precedence over operators outside. This is also similar to the use of parentheses in an algebraic expression e.g., $(5+7)/2$.

For instance, the following expression:

```
MIT AND (LGPL-2.1-or-later OR BSD-3-Clause)
```

states the OR operator should be applied before the AND operator. That is, one should first select between the LGPL-2.1-or-later or the BSD-3-Clause license before applying the MIT license.

B.4.6 License expressions in RDF

A conjunctive license can be expressed in RDF via a `<spdx:ConjunctiveLicenseSet>` element, with an `spdx:member` property for each element in the conjunctive license. Two or more members are required.

⁵<https://spdx.org/licenses>

```

<spdx:ConjunctiveLicenseSet>
  <spdx:member rdf:resource="http://spdx.org/licenses/GPL-2.0-only"/>
  <spdx:ExtractedLicensingInfo rdf:about
    ="http://example.org#LicenseRef-EternalSurrender">
    <spdx:extractedText>
      In exchange for using this software, you agree to give
      its author all your worldly possessions. You will not
      hold the author liable for all the damage this software
      will inevitably cause not only to your person and
      property, but to the entire fabric of the cosmos.
    </spdx:extractedText>
    <spdx:licenseId>LicenseRef-EternalSurrender</spdx:licenseId>
  </spdx:ExtractedLicensingInfo>
</spdx:ConjunctiveLicenseSet>

```

A disjunctive license can be expressed in RDF via a `<spdx:DisjunctiveLicenseSet>` element, with an `spdx:member` property for each element in the disjunctive license. Two or more members are required.

```

<spdx:DisjunctiveLicenseSet>
  <spdx:member rdf:resource="http://spdx.org/licenses/GPL-2.0-only"/>
  <spdx:member>
    <spdx:ExtractedLicensingInfo rdf:about
      ="http://example.org#LicenseRef-EternalSurrender">
      <spdx:extractedText>
        In exchange for using this software, you agree to
        give its author all your worldly possessions. You
        will not hold the author liable for all the damage
        this software will inevitably cause not only to
        your person and property, but to the entire fabric
        of the cosmos.
      </spdx:extractedText>
      <spdx:licenseId>LicenseRef-EternalSurrender</spdx:licenseId>
    </spdx:ExtractedLicensingInfo>
  </spdx:member>
</spdx:DisjunctiveLicenseSet>

```

A License Exception can be expressed in RDF via a `<spdx:LicenseException>` element. This element has the following unique mandatory (unless specified otherwise) attributes:

- `comment` - An `rdfs:comment` element describing the nature of the exception.
- `seeAlso` (optional, one or more)- An `rdfs:seeAlso` element referencing external sources of information on the exception.
- `example` (optional) - Text describing examples of this exception.
- `name` - The full human readable name of the item.
- `licenseExceptionId` - The identifier of an exception in the SPDX License List to which the exception applies.
- `licenseExceptionText` - Full text of the license exception.

```

<rdf:Description rdf:about
  ="http://example.org#SPDXRef-ButIdDontWantToException">
  <rdfs:comment>This exception may be invalid in some
    jurisdictions.</rdfs:comment>
  <rdfs:seeAlso>http://dilbert.com/strip/1997-01-15</rdfs:seeAlso>
  <spdx:example>So this one time, I had a license exception
    ...</spdx:example>
  <spdx:licenseExceptionText>
    A user of this software may decline to follow any subset of
    the terms of this license upon finding any or all such terms
    unfavorable.
  </spdx:licenseExceptionText>

```

```
</spdx:licenseExceptionText>
<spdx:name>&quot;But I Don&apos;t Want To&quot; Exception</spdx:name>
<spdx:licenseExceptionId>SPDXRef-ButIdDontWantToException</spdx:licenseExceptionId>
<rdf:type rdf:resource
  ="http://spdx.org/rdf/terms#LicenseException"/>
</rdf:Description>
```

Annex C

SPDX License List matching guidelines and templates (Normative)

C.1 SPDX License List matching guidelines

The SPDX License List Matching Guidelines provide guidelines to be used for the purposes of matching licenses and license exceptions against those included on the SPDX License List¹. There is no intent here to make a judgment or interpretation, but merely to ensure that when one SPDX user identifies a license as “BSD-3-Clause,” for example, it is indeed the same license as what someone else identifies as “BSD-3-Clause” and the same license as what is listed on the SPDX License List. As noted here, some of the matching guidelines are implemented in the XML files of the SPDX License List repository.

C.2 How these guidelines are applied

C.2.1 Purpose

To ensure consistent results by different SPDX document creators when matching license information that will be included in SPDX data. SPDX document creators or tools may match on the license or exception text itself, the official license header, or the SPDX License List short identifier.

C.2.2 Guideline: official license headers

The matching guidelines apply to license and exception text, as well as official license headers. Official license headers are defined by the SPDX License List as specific text specified within the license itself to be put in the header of files. (see explanation of SPDX License List fields² for more info).

The following XML tag is used to implement this guideline: `<standardLicenseHeader>`

C.3 Substantive text

C.3.1 Purpose

To ensure that when matching licenses and exceptions to the SPDX License List, there is an appropriate balance between matching against the substantive text and disregarding parts of the text that do not alter the substantive text or legal meaning. Further guidelines of what can be disregarded or considered replaceable for purposes of matching are listed below here and in the subsequent specific guidelines. A conservative approach is taken in regard to rules relating to disregarded or replaceable text.

C.3.2 Guideline: verbatim text

License and exception text should be the same verbatim text (except for the guidelines stated here). The text should be in the same order, e.g., differently ordered paragraphs would not be considered a match.

¹<https://spdx.org/licenses/>

²<https://github.com/spdx/license-list-XML/blob/v3.25.0/DOCS/license-fields.md>

C.3.3 Guideline: no additional text

Matched text should only include that found in the vetted license or exception text. Where a license or exception found includes additional text or clauses, this should not be considered a match.

C.3.4 Guideline: replaceable text

Some licenses include text that refers to the specific copyright holder or author, yet the rest of the license is exactly the same. The intent here is to avoid the inclusion of a specific name in one part of the license resulting in a non-match where the license is otherwise an exact match to the legally substantive terms (e.g., the third clause and disclaimer in the BSD licenses, or the third, fourth, and fifth clauses of Apache-1.1). In these cases, there should be a positive license match.

The text indicated as such can be replaced with similar values (e.g., a different name or generic term; different date) and still be considered a positive match. This rule also applies to text-matching in official license headers, see Guideline: official license headers.

The following XML tag is used to implement this guideline. `<alt>` with 2 attributes:

- `match` - a POSIX extended regular expression (ERE) to match the replaceable text
- `name` - an identifier for the variable text unique to the license XML document

The original text is enclosed within the beginning and ending alt tags.

For example: `<alt match="(?:copyright.{0,200})." name="copyright1">Copyright The Linux Foundation</alt>`

The original replaceable text appears on the SPDX License List webpage in red text.

C.3.5 Guideline: omissible text

Some licenses have text that can simply be ignored. The intent here is to avoid the inclusion of certain text that is superfluous or irrelevant in regards to the substantive license text resulting in a non-match where the license is otherwise an exact match (e.g., directions on how to apply the license or other similar exhibits). In these cases, there should be a positive license match.

The license should be considered a match if the text indicated is present and matches OR the text indicated is missing altogether.

The following XML tag is used to implement this guideline: `<optional>`

For example: `<optional>Apache License Version 2.0, January 2004 http://www.apache.org/licenses/</optional>`

Omissible text appears on the SPDX License List webpage in blue text.

C.4 Whitespace

C.4.1 Purpose

To avoid the possibility of a non-match due to different spacing of words, line breaks, or paragraphs.

C.4.2 Guideline

All whitespace should be treated as a single blank space.

XML files do not require specific markup to implement this guideline.

C.5 Capitalization

C.5.1 Purpose

To avoid the possibility of a non-match due to lowercase or uppercase letters in otherwise the same words.

C.5.2 Guideline

All uppercase and lowercase letters should be treated as lowercase letters.

XML files do not require specific markup to implement this guideline.

C.6 Punctuation

C.6.1 Purpose

Because punctuation can change the meaning of a sentence, punctuation needs to be included in the matching process.

XML files do not require specific markup to implement this guideline, unless to indicate an exception to the guideline.

C.6.2 Guideline: punctuation

Punctuation should be matched, unless otherwise stated in these guidelines or unless specific markup is added.

C.6.3 Guideline: hyphens, dashes

Any hyphen, dash, en dash, em dash, or other variation should be considered equivalent.

C.6.4 Guideline: Quotes

Any variation of quotations (single, double, curly, etc.) should be considered equivalent.

C.7 Code Comment Indicators or Separators

C.7.1 Purpose

To avoid the possibility of a non-match due to the existence or absence of code comment indicators placed within the license text, e.g., at the start of each line of text, or repetitive characters to establish a separation of text, e.g., ---, ===, ____, or ***.

C.7.2 Guideline

Any kind of code comment indicator or prefix which occurs at the beginning of each line in a matchable section should be ignored for matching purposes.

XML files do not require specific markup to implement this guideline.

C.7.3 Guideline

A non-letter character repeated 3 or more times to establish a visual separation should be ignored for matching purposes.

XML files do not require specific markup to implement this guideline.

C.8 Bullets and numbering

C.8.1 Purpose

To avoid the possibility of a non-match due to the otherwise same license using bullets instead of numbers, number instead of letter, or no bullets instead of bullet, etc., for a list of clauses.

C.8.2 Guideline

Where a line starts with a bullet, number, letter, or some form of a list item (determined where list item is followed by a space, then the text of the sentence), ignore the list item for matching purposes.

The following XML tag is used to implement this guideline: `<bullet>`

For example: `<bullet>1.0</bullet>`

C.9 Varietal word spelling

C.9.1 Purpose

English uses different spelling for some words. By identifying the spelling variations for words found or likely to be found in licenses, we avoid the possibility of a non-match due to the same word being spelled differently. This list is not meant to be an exhaustive list of all spelling variations, but meant to capture the words most likely to be found in open source software licenses.

C.9.2 Guideline

The words in each line of the text file available at the equivalent words list³ are considered equivalent and interchangeable.

XML files do not require specific markup to implement this guideline.

C.10 Copyright symbol

C.10.1 Purpose

By having a rule regarding the use of “©”, “(c)”, or “copyright”, we avoid the possibility of a mismatch based on these variations.

C.10.2 Guideline

“©”, “(c)”, or “Copyright” should be considered equivalent and interchangeable.

XML files do not require specific markup to implement this guideline. The copyright symbol is part of the copyright notice, see implementation of that guideline in Copyright notice.

C.11 Copyright notice

C.11.1 Purpose

To avoid a license mismatch merely because the copyright notice (usually found above the actual license or exception text) is different. The copyright notice is important information to be recorded elsewhere in the SPDX document, but for the purposes of matching a license to the SPDX License List, it should be ignored because it is not part of the substantive license text.

³<https://spdx.org/licenses/equivalentwords.txt>

C.11.2 Guideline

Ignore copyright notices. A copyright notice consists of the following elements, for example: “2012 Copyright, John Doe. All rights reserved.” or “(c) 2012 John Doe.”

The following XML tag is used to implement this guideline: `<copyrightText>`

For example: `<copyrightText>Copyright 2022 The Linux Foundation</copyrightText>`

C.12 License name or title

C.12.1 Purpose

To avoid a license mismatch merely because the name or title of the license is different than how the license is usually referred to or different than the SPDX full name. This also avoids a mismatch if the title or name of the license is simply not included.

C.12.2 Guideline

Ignore the license name or title for matching purposes, so long as what ignored is the title only and there is no additional substantive text added here.

The following XML tag is used to implement this guideline: `<titleText>`

For example: `<titleText>Attribution Assurance License</titleText>`

C.13 Extraneous text at the end of a license

C.13.1 Purpose

To avoid a license mismatch merely because extraneous text that appears at the end of the terms of a license is different or missing. This also avoids a mismatch if the extraneous text merely serves as a license notice example and includes a specific copyright holder’s name.

C.13.2 Guideline

Ignore any text that occurs after the obvious end of the license and does not include substantive text of the license, for example: text that occurs after a statement such as, “END OF TERMS AND CONDITIONS,” or an exhibit or appendix that includes an example or instructions on how to apply the license to your code. Do not apply this guideline or ignore text that is comprised of additional license terms (e.g., permitted additional terms under GPL-3.0, section 7).

To implement this guideline, use the `<optional>` XML element tag as described in Guideline: omissible text.

C.14 HTTP protocol

C.14.1 Purpose

To avoid a license mismatch due to a difference in a hyperlink protocol (e.g. HTTP vs. HTTPS).

C.14.2 Guideline

`http://` and `https://` should be considered equivalent.

XML files do not require specific markup to implement this guideline.

C.15 SPDX License List

C.15.1 Template access

The license XML can be accessed in the license-list-data repository under the license-list-XML directory. Although the license list XML files can also be found in the license-list-XML⁴ repository, users are encouraged to use the published versions in the license-list-data5 repository. The license-list-data repository is tagged by release. Only tagged released versions of the license list are considered stable.

C.15.2 License List XML format

A full schema for the License List XML can be found at SPDX License List XML Schema⁶.

C.15.3 Legacy Text Template format

Prior to the XML format, a text template was used to express variable and optional text in licenses. This text template is still supported, however, users are encouraged to use the more expressive XML format.

A legacy template is composed of text with zero or more rules embedded in it.

A rule is a variable section of a license wrapped between double angle brackets <<>> and is composed of 4 fields. Each field is separated with a semi-colon ;. Rules cannot be embedded within other rules. Rule fields begin with a case sensitive tag followed by an equal sign =.

Rule fields:

- **type:** indicates whether the text is replaceable or omissible as per Substantive text guidelines.
 - Indicated by <<var; . . . >> or
 - Indicated by <<beginOptional; . . . >> and <<endOptional>> respectively.
 - This field is the first field and is required.
- **name:** name of the field in the template.
 - This field is unique within each license template.
 - This field is required.
- **original:** the original text of the rule.
 - This field is required for a rule type: <<var; . . . >>
- **match:** a POSIX extended regular expression (ERE).
 - This field is required for a rule type: <<var; . . . >>

The POSIX ERE⁷ in the match field has the following restrictions and extensions:

- Semicolons are escaped with \;
- POSIX Bracket Extensions are not allowed

For example: <<var;name=organizationClause3;original=the copyright holder;match=.+>>

Annex D

SPDX Lite (Normative)

D.1 Explanation of the Lite profile

The Lite profile is designed to make it quick and easy to start a Software Bill of Materials in situations where a company may have limited capacity for introducing new items into their processes. The Lite profile captures the minimum set of information required for license compliance in the software supply chain. It contains information about the creation of the SBOM, package lists with licensing and other related information, and their relationships.

All elements in Lite profile are essential for complying with licenses. It is easy to use a SPDX document with the Lite profile for anyone who does not have enough knowledge about licensing information and easy to import license information from former versions of SPDX Lite format files. The Lite profile offers the flexibility to be used either alone or in combination with other SPDX profiles as a SPDX document in the software supply chain.

D.2 Mandatory and recommended properties

The Lite profile specifies that some properties **MUST** be present and some others **SHOULD** be present, as much as possible.

The following lists collect and present this information for every class present in the SPDX data, in a concise and easy-to-follow format. The lists of properties are in alphabetical order, for easy reference.

D.2.1 /Core/SpdxDocument

- Mandatory
 1. creationInfo
 2. element (may be multiple), **MUST** have at least one /Core/Sbom object
 3. rootElement (may be multiple), **SHOULD** be objects of type /Core/Sbom
 4. spdxId
- Recommended
 1. comment
 2. dataLicense
 3. name
 4. namespaceMap (may be multiple)
 5. verifiedUsing (may be multiple), **SHOULD** be objects of type /Core/Hash

D.2.2 /Software/Sbom

- Mandatory
 1. creationInfo
 2. element (may be multiple), **MUST** have at least one /Software/Package object
 3. rootElement (may be multiple), **SHOULD** be objects of type /Software/Package
 4. spdxId
- Recommended
 1. sbomType (may be multiple)

D.2.3 /Software/Package

- Mandatory
 1. copyrightText
 2. creationInfo
 3. name
 4. packageVersion
 5. spdxId
 6. suppliedBy, SHOULD be an object of type /Core/Agent
- Recommended
 1. attributionText (may be multiple)
 2. builtTime
 3. comment
 4. downloadLocation
 5. homepage
 6. originatedBy (may be multiple), SHOULD be objects of type /Core/Agent
 7. packageUrl
 8. releaseTime
 9. supportLevel (may be multiple)
 10. validUntilTime
 11. verifiedUsing (may be multiple), SHOULD be objects of type /Core/Hash

However, there MUST be at least a “downloadLocation” or “packageUrl” property.

Additionally:

1. for every /Software/Package object MUST exist exactly one /Core/Relationship object of type hasConcludedLicense having that element as its from property and an /SimpleLicensing/AnyLicenseInfo as its to property.
2. for every /Software/Package object MUST exist exactly one /Core/Relationship object of type hasDeclaredLicense having that element as its from property and /SimpleLicensing/AnyLicenseInfo object as its to property.

D.2.4 /Core/Hash

- Mandatory
 1. algorithm
 2. hashValue
- Recommended
 1. comment

D.2.5 /SimpleLicensing/LicenseExpression

- Mandatory
 1. creationInfo
 2. licenseExpression
 3. spdxId
- Recommended
 1. licenseListVersion

D.2.6 /SimpleLicensing/SimpleLicensingText

- Mandatory
 1. creationInfo
 2. licenseText
 3. spdxId
- Recommended
 1. comment

D.2.7 /Core/Agent (createdBy, suppliedBy, originatedBy)

- Mandatory
 1. creationInfo, SHOULD be “BlankNode”
 2. name
 3. spdxId
- Recommended
 1. externalIdentifier (may be multiple)

D.2.8 /Core/CreationInfo

- Mandatory
 1. created
 2. createdBy (may be multiple), SHOULD be objects of type /Core/Agent
 3. specVersion, MUST be a fixed string, “3.0.1”.
- Recommended
 1. comment

D.2.9 /Core/ExternalIdentifier

- Mandatory
 1. externalIdentifierType
 2. identifier

D.2.10 /Core/NameSpaceMap

- Mandatory
 1. namespace
 2. prefix

D.2.11 /Core/Relationship

- Mandatory
 1. creationInfo
 2. from
 3. relationshipType
 4. spdxId
 5. to (may be multiple)

Annex E

Package URL specification v1 (Normative)

E.1 Introduction

The Package URL core specification defines a versioned and formalized format, syntax, and rules used to represent and validate package URLs.

A package URL or *purl* is an attempt to standardize existing approaches to reliably identify the location of software packages.

A *purl* is a URL string used to identify the location of a software package in a mostly universal and uniform way across programming languages, package managers, packaging conventions, tools, APIs and databases.

Such a package URL is useful to reliably reference the same software package using a simple and expressive syntax and conventions based on familiar URLs.

E.2 Syntax definition

purl stands for **package URL**.

A *purl* is a URL composed of seven components:

```
scheme:type/namespace/name@version?qualifiers#subpath
```

Components are separated by a specific character for unambiguous parsing.

The definition for each components is:

- **scheme**: this is the URL scheme with the constant value of “pkg”. One of the primary reason for this single scheme is to facilitate the future official registration of the “pkg” scheme for package URLs. Required.
- **type**: the package type or package protocol such as maven, npm, nuget, gem, pypi, etc. Required.
- **namespace**: some name prefix such as a Maven groupid, a Docker image owner, a GitHub user or organization. Optional and type-specific.
- **name**: the name of the package. Required.
- **version**: the version of the package. Optional.
- **qualifiers**: extra qualifying data for a package such as an OS, architecture, a distribution, etc. Optional and type-specific.
- **subpath**: extra subpath within a package, relative to the package root. Optional.

Components are designed such that they form a hierarchy from the most significant on the left to the least significant components on the right.

A *purl* is a valid URL and URI that conforms to the URL definitions and specifications in RFC 3986 <https://datatracker.ietf.org/doc/rfc3986>.

A *purl* must not contain a URL Authority i.e. there is no support for username, password, host and port components. A namespace segment may sometimes look like a host but its interpretation is specific to a type.

The *purl* components are mapped to the following URL components:

- *purl* scheme: this is a URL scheme with a constant value: `pkg`
- *purl* type, namespace, name and version components: these are collectively mapped to a URL path
- *purl* qualifiers: this maps to a URL query
- *purl* subpath: this is a URL fragment

E.3 Character encoding

For clarity and simplicity a *purl* is always an ASCII string. To ensure that there is no ambiguity when parsing a *purl*, separator characters and non-ASCII characters must be encoded in UTF-8, and then percent-encoded as defined in RFC 3986 <https://datatracker.ietf.org/doc/rfc3986>.

Use these rules for percent-encoding and decoding *purl* components:

- the type must NOT be encoded and must NOT contain separators
- the #, ?, @ and : characters must NOT be encoded when used as separators. They may need to be encoded elsewhere
- the : scheme and type separator does not need to and must NOT be encoded. It is unambiguous unencoded everywhere
- the / used as type/namespace/name and subpath segments separator does not need to and must NOT be percent-encoded. It is unambiguous unencoded everywhere
- the @ version separator must be encoded as %40 elsewhere
- the ? qualifiers separator must be encoded as %3F elsewhere
- the = qualifiers key/value separator must NOT be encoded
- the # subpath separator must be encoded as %23 elsewhere
- All non-ASCII characters must be encoded as UTF-8 and then percent-encoded

It is OK to percent-encode any *purl* components, except for the type. Producers and consumers of *purl* data must always percent-decode and percent-encode components and component segments as explained in the “How to produce and consume *purl* data” section.

E.4 Rules for each component

A *purl* string is an ASCII URL string composed of seven components.

Some components are allowed to use other characters beyond ASCII: these components must then be UTF-8-encoded strings and percent-encoded as defined in the “Character encoding” section.

The rules for each component are:

E.4.1 Rules for scheme

- The scheme is a constant with the value “`pkg`”
- Since a *purl* never contains a URL Authority, its scheme must not be suffixed with double slash as in `pkg://` and should use instead `pkg:`.
- *purl* parsers must accept URLs such as `pkg://` and must ignore the `///`.
- *purl* builders must not create invalid URLs with such double slash `///`.
- The scheme is followed by a `:` separator.
- For example, the two *purls* `pkg:gem/ruby-advisory-db-check@0.12.4` and `pkg://gem/ruby-advisory-db-check` are strictly equivalent. The first is in canonical form while the second is an acceptable *purl* but is an invalid URI/URL per RFC3986.

E.4.2 Rules for type

- The package type is composed only of ASCII letters and numbers, `.`, `+` and `-` (period, plus, and dash).
- The type cannot start with a number.

- The type cannot contain spaces.
- The type must not be percent-encoded.
- The type is case insensitive, with the canonical form being lowercase.

E.4.3 Rules for namespace

- The optional namespace contains zero or more segments, separated by slash /.
- Leading and trailing slashes / are not significant and should be stripped in the canonical form. They are not part of the namespace.
- Each namespace segment must be a percent-encoded string.
- When percent-decoded, a segment must not contain a slash / and must not be empty.
- A URL host or Authority must NOT be used as a namespace. Use instead a `repository_url` qualifier. Note however that for some types, the namespace may look like a host.

E.4.4 Rules for name

- The name is prefixed by a slash / separator when the namespace is not empty.
- This slash / is not part of the name.
- A name must be a percent-encoded string.

E.4.5 Rules for version

- The version is prefixed by a at-sign @ separator when not empty.
- This at-sign @ is not part of the version.
- A version must be a percent-encoded string.
- A version is a plain and opaque string. Some package types use versioning conventions such as SemVer for NPMs or NEVRA conventions for RPMS. A type may define a procedure to compare and sort versions, but there is no reliable and uniform way to do such comparison consistently.

E.4.6 Rules for qualifiers

- The qualifiers string is prefixed by a ? separator when not empty.
- This ? is not part of the qualifiers.
- This is a string composed of zero or more key=value pairs each separated by an ampersand &. A key and value are separated by an equal = character.
- These & are not part of the key=value pairs.
- Each key must be unique within the keys of the qualifiers string.
- A value cannot be an empty string; a key=value pair with an empty value is the same as no key/value at all for this key.
- Each key must be composed only of ASCII letters and numbers, ., - and _ (period, dash and underscore).
- A key cannot start with a number.
- A key must NOT be percent-encoded.
- A key is case insensitive, with the canonical form being lowercase.
- A key cannot contain spaces.
- A value must be a percent-encoded string.
- The = separator is neither part of the key nor of the value.

E.4.7 Rules for subpath

- The subpath string is prefixed by a # separator when not empty.
- This # is not part of the subpath.
- The subpath contains zero or more segments, separated by slash /.
- Leading and trailing slashes / are not significant and should be stripped in the canonical form.
- Each subpath segment must be a percent-encoded string.
- When percent-decoded, a segment must not contain a /, must not be any of . . or . , and must not be empty.

- The subpath must be interpreted as relative to the root of the package.

E.5 Known types

There are several known *purl* package type definitions. The current list of known types is: *alpm*, *apk*, *bitbucket*, *bitnami*, *cargo*, *cocoapods*, *composer*, *conan*, *conda*, *cpan*, *cran*, *deb*, *docker*, *gem*, *generic*, *github*, *golang*, *hackage*, *hex*, *huggingface*, *luarocks*, *maven*, *mlflow*, *npm*, *nuget*, *oci*, *pub*, *pypi*, *qpkg*, *rpm*, *swid*, and *swift*.

The list, with definitions for each type, is maintained in the file named `PURL-TYPES.rst` in the online repository <https://github.com/package-url/purl-spec>.

E.6 Known qualifiers key/value pairs

Qualifiers should be limited to the bare minimum for proper package identification, to ensure that a *purl* stays compact and readable in most cases. Separate external attributes stored outside of a *purl* are the preferred mechanism to convey extra long and optional information. API, database or web form.

The following keys are valid for use in all package types:

- `repository_url` is an extra URL for an alternative, non-default package repository or registry. The default repository or registry of each type is documented in the “Known types” section.
- `download_url` is an extra URL for a direct package web download URL.
- `vcs_url` is an extra URL for a package version control system URL.
- `file_name` is an extra file name of a package archive.
- `checksum` is a qualifier for one or more checksums stored as a comma-separated list. Each item in the list is in form of `algorithm:hex_value` (all lowercase), such as `sha1 : ad9503c3e994a4f611a4892f2e67ac82df727086`.

E.7 How to produce and consume *purl* data

The following provides rules to be followed when building or deconstructing *purl* instances.

E.7.1 How to build *purl* string from its components

Building a *purl* ASCII string works from left to right, from type to subpath.

To build a *purl* string from its components:

1. Start a *purl* string with the “`pkg:`” scheme as a lowercase ASCII string
2. Append the type string to the *purl* as a lowercase ASCII string
3. Append `/` to the *purl*
4. If the namespace is not empty:
 1. Strip the namespace from leading and trailing `/`
 2. Split on `/` as segments
 3. Apply type-specific normalization to each segment, if needed
 4. Encode each segment in UTF-8-encoding
 5. Percent-encode each segment
 6. Join the segments with `/`
 7. Append this to the *purl*
 8. Append `/` to the *purl*
5. Strip the name from leading and trailing `/`

6. Apply type-specific normalization to the name, if needed
7. Encode the name in UTF-8-encoding
8. Percent-encode the name
9. Append the percent-encoded name to the *purl*
10. If the version is not empty:
 1. Append @ to the *purl*
 2. Encode the version in UTF-8-encoding
 3. Percent-encode the version
 4. Append the percent-encoded version to the *purl*
11. If the qualifiers are not empty and not composed only of key/value pairs where the value is empty:
 1. Append ? to the *purl*
 2. Discard any pair where the value is empty
 3. Encode each value in UTF-8-encoding
 4. If the key is checksum and there are more than one checksums, join the list with , to create the qualifier value
 5. Create each qualifier string by joining the lowercased key, the equal = sign, and the percent-encoded value
 6. Sort this list of qualifier strings lexicographically
 7. Join this list of sorted qualifier strings with &
 8. Append this string to the *purl*
12. If the subpath is not empty and not composed only of empty, ., and . . segments:
 1. Append # to the *purl*
 2. Strip the subpath from leading and trailing /
 3. Split the subpath on / as a list of segments
 4. Discard empty, ., and . . segments
 5. Encode each segment in UTF-8-encoding
 6. Percent-encode each segment
 7. Join the segments with /
 8. Append this string to the *purl*

E.7.2 How to parse a *purl* string to its components

Parsing a *purl* ASCII string into its components works by splitting the string on different characters.

To parse a *purl* string in its components:

1. Split the *purl* string once from right on #, if present; the left side is the remainder.
2. If the right side is not empty, it contains subpath information:
 1. Strip it from leading and trailing /.
 2. Split this on / in a list of segments.
 3. Discard empty, ., and . . segments.
 4. Percent-decode each segment.
 5. UTF-8-decode each of these.
 6. Join segments with /.
 7. This is the subpath.
3. Split the remainder once from right on ?, if present; the left side is the remainder.

4. If the right side is not empty, it contains qualifiers information:
 1. Split it on & in a list of key=value pairs.
 2. Split each pair once from left on = in key and value parts.
 3. The key is the lowercase left side.
 4. Percent-decode the right side.
 5. UTF-8-decode this to get the value.
 6. Discard any key/value pairs where the value is empty.
 7. If the key is checksum, split the value on , to create a list of checksums.
 8. This list of keys/values is the qualifiers.
5. Split the remainder once from left on ; the right side is the remainder.
6. The left side lowercased is the scheme. It should be exactly "pkg:".
7. Strip the remainder from leading and trailing /.
8. Split this once from left on /; the right side is the remainder.
9. The left side lowercased is the type.
10. Split the remainder once from right on @, if present; the left side is the remainder.
11. If the right side is not empty, it contains version information:
 1. Percent-decode the string.
 2. UTF-8-decode this.
 3. This is the version.
12. Split the remainder once from right on /, if present; the left side is the remainder.
13. The right side contains name information.
14. Percent-decode the name string.
15. UTF-8-decode this.
16. Apply type-specific normalization, if needed.
17. This is the name.
18. If the remainder is not empty, it contains namespace information:
 1. Split the remainder on / to a list of segments.
 2. Discard any empty segment.
 3. Percent-decode each segment.
 4. UTF-8-decode each of these.
 5. Apply type-specific normalization to each segment, if needed.
 6. Join segments with /.
 7. This is the namespace.

E.8 Examples

The following list includes some valid *purl* examples:

- pkg:bitbucket/birkenfeld/pygments-main@244fd47e07d1014f0aed9c
- pkg:deb/debian/curl@7.50.3-1?arch=i386&distro=jessie
- pkg:gem/ruby-advisory-db-check@0.12.4

- `pkg:github/package-url/purl-spec@244fd47e07d1004f0aed9c`
- `pkg:golang/google.golang.org/genproto#googleapis/api/annotations`
- `pkg:maven/org.apache.xmlgraphics/batik-anim@1.9.1?packaging=sources`
- `pkg:npm/foobar@12.3.1`
- `pkg:nuget/EnterpriseLibrary.Common@6.0.1304`
- `pkg:pypi/django@1.11.1`
- `pkg:rpm/fedora/curl@7.50.3-1.fc25?arch=i386&distro=fedora-25`

E.9 Original license
